the points of tangency of tangents from that point to the conic. The harmonic mean of the distances from the fixed point measured along any given radius of the intersections of any polar of that point, is the same as that of the distances of the intersections of the primitive curve; the distances of the intersections of the primitive curve; and the same is equally true of products of pairs or triplets or any number of intersections. In a generalized sense, mathematicians speak of a polar of a curve with respect to another curve: if the tangential equation of the first curve is $(a, b, c, \dots, y, a, v, x, y)^*$, and the point-equation of the second curve is $(A, B, C, \dots, y, x, y, x)^m$, where m > x, then the polar of the first with respect to the second is

 $(a, b, c, \ldots) d/dx, d/dy, d/dz)^x (A, B, C, \ldots) (x, y, z)^m$. But if s>m, the polar of the second curve with respect to the first is

The more complex and convenient forms have polarizing prisms of Iceland spar mounted in a vertical stand resembling that of a interoscope, with a movable stage, coarse adjustment, and other arrangements. When the polariscope is essentially a microscope with Nicol prisms and attachments for viewing crystal-sections in polarised light, it is usually called a polarizon-microscope. polarity (po-lar'i-ti), n. [= F. polarité = Sp. polaridad = l'g. polaridade = It. polarità, NI. "polarida(t-)s, < polaris, polar: see polar.] 1.

The having two opposite poles; variation in certain physical properties, so that in one direction they are the opposite of what they are in the opposite direction: thus, a magnet has in the opposite direction: thus, a magnet has polarity. I smally, as in electrified or magnetized bodies, these are proporties of attraction or repulsion, or the power of taking a certain direction: as, the polarity of the magnet or magnetic needle. (See magnet.) A substance is said to possess magnetic polarity when it possess magnetic polarity when it possess composes, as shown by the fact that it attracts one pole of a magnetic needle and repols the other.

A magnetical property which some call polarity.

Boyle, Works, III, 300.

2. The being attracted to one pole and repelled from the other; attraction of opposites: literal or figurative: as, electricity has polarity.

It seemed Clifford's nature to be a Sybarite. It was perceptible even there, in the dark old parior, in the inevitable polarity with which his eyes were attracted towards the quivering play of sunbeams through the shadowy foliage.

Hauthorne, Seven Gables, vii.

8. The having of an axis with reference to which certain physical properties are deter-mined.—4. The having, as a ray, variation of properties in reference to different inclinations properties in reference to different medications to a plane through the ray; polarization. [This use of the word is objectionable.]

polarizable (pō'lir-ī-za-bl), a. [< polarize + -able.] Capable of being polarized. Also spelled

polarisable.

polarization (pō'lär-i-zā'shon), n. [= F. polarization = It. polarizzazione; as polarize + -ation.] 1. The state, or the act producing the -ation.] 1. The state, or the act producing the state, of having, as a ray, different properties on its different sides, so that opposite sides are on its different sides, so that opposite sides are alike, but the maximum difference is between two sides at right angles to each other. This polaryt (pō'la-ri), a. [< NL. polaris: see potwo sides at right angles to each other. This contains the polaryt (pō'la-ri), a. [< NL. polaris: see potwo sides at right angles to each other. on its different sides, so that opposite sides are alike, but the maximum difference is between two sides at right angles to each other. This is the case with polarized light.—2. Less properly, the acquisition of polarity, in any sense. Also spelled polarisation.

Angle of polarisation, circular polarisation. See polarization of light.— Electrolytic polarisation, in elect.: (a) The process of depositing a film of gas upon the plate in a voltaic cell, or upon the electrodes in electrolysis. (b) The condition thus produced. Thus, in the electrolysis of water polarization of the electrodes takes place, the one becoming coated with a film of oxygen, the ofter with a film of hydrogen gas. The phrase is most frequently used to describe the process by which the negative plate in a voltaic cell becomes coated with hydrogen, with the result of giving rise to a reverse electromotive force, and thus of weakening the current. On the methods of preventing this, see cell. S.—Elliptic polarization, the plane which includes the incident ray and the ray which is reflected (or refracted) and polarization, the plane which includes the incident ray and the ray which is reflected (or refracted) and polarization, a phrase introduced by Faraday to describe the condition of a non-conductor or delectric, as he conceived it, when in a state of strain under the action of two adjacent charges of positive and negative electricity, as, for example, in the condensor.—Polarization of fight, a change produced in light by reflection from or transmission through certain media by which the transverse vibrations of the ether (see light) are limited to a single plane, while in a ray of ordinary light these vibrations its place indifferently in any plane about the line of propagation. Polarization may be affected (1) by reflection from a surface of glass, water, or similar substance, and it is most complete if the angle of incidence has a certain value, depending upon the substance, called the angle of the polarization (for glass 5417), the tangent

or simply a nicol. If two such prisms are placed in the path of a beam of ordinary light, it will pass through them if their positions are parallel; if, however, the nicols are crossed—that is, have their shorter diagonals, or, in other words, their wibration-planes, at right angles to each other—the light which passes through the first prism (called the polarizer) will be extinguished by the second (called the nonlyzer). Two sections of a crystal of tournallin, another doubly refracting substance, cut parallel to the vertical axis, will act in the same way as the nicols, transmitting the light if placed parallel, arresting it if placed with axes at right angles to each other. In the tournally one of the rays is almost entirely absorbed by the crystal, and that which passes through is polarized with its vibrations parallel to the axis. In addition to the above linear plane polarization of a light-ray, there is also what is called circular and sliptical polarization, in which the vibrations of the ether-particles take place in circles and ellipses. This property, belonging to certain substances, as quarts, chunsbar, and solution of sungar, has the effect of rotating the plane of polarization of the light transmitted through them to the right (right-handed) or to the left (left-handed). A light-ray passing through a transparent medium in a strong magnetic field, or reflected from the pole of a powerful electromagnet, also suffers a rotation of the plane of polarization. See rotation, and rotatory power, under rotatory.

3. In general, a point on a sphere equally distant from every part of the circumference of a great from every part of the circumference of a great circle of the sphere. Every great circle has two such poles, which lie in a line passing through the center of the sphere and perpondicular to the plane of the great circle—that is, in an axis of the sphere. Thus, the zenith and nadir (on the celestial sphere) are the poles of the horizon. So the poles of the cellptic are two points on the surface of the celestial sphere equally distant (80°) from every part of the cellptic.

(a) One of the points on the earth's surface where the dipping-needle stands vertical. The term has also sometimes been improperly applied to the points of maximum magnetic intensity, of which there are two in each hemisphere, neither of them near the pole of dip. (b) In a magnetic body, either of the two points about which two opposite magnetic forces are generally most intense. A line joining these points is called the magnetic axis, and generally a magnet may be considered as if the magnetic forces were concentrated at the extremity of this line. When a magnetic body is freely suspended, the magnetic axis assumes a direction parallel with the lines of force of the nagnetic field in which it is. On the surface of the earth this direction is in a vertical plane approximately north and south, and that end of the magnet which points to the north is generally called the north pole or the north-seeking pole. The fact that the real magnetism of this pole is upposite in character to that of the north pole of the earth gives rise to some confusion in the nomenciature of the poles. Some physicists have used the epithets market and unmarked to designate the north-seeking and south-seeking poles respectively. The words austral and boreal are also used. A magnet may have more than two poles, or points of maximum magnetic intensity, and in fact it may be assumed that all parts of a magnet are in a state of polarity, the actual poles of the magnet being the result of all polarization.—Builtiple pole. Same as multipolar.—Pole of a glass, in optics, the thickest part of a convex lens, or the thinnest part of a concave lens; the center of its surface. —Syn. 2. Civil. Polite, Courtones, Urbane, Completions, gracious, affable, courtly, gentlemanly, ladylike. Civil, literally, applies to one who fulfils the duty of a citi-

sen; it may mean simply not rude, or observant of the external courtesies of intercourse, or quick to do and say gratifying and complimentary things. Polits applies to one who shows a poliahed civility, who has a higher training in ease and gracefulness of manners; politeness is a deeper, more comprehensive, more delicate, and perhaps more genuine thing that a civility. Polits, though much abused, is becoming the standard word for the bearing of a refused and kind person toward others. Courteous, literally, expresses that style of politeness which belongs to courie: a courteous man is one who is gracefully respectful in his address and manner—one who exhibits a union of dignified complaisance and kindness. The word applies to all sincere kindness and attention. Urbane, literally city-like, expresses a sort of politeness which is not only sincere and kind, but peculiarly suave and agreeable. Complaisant applies to one who pleases by being pleased, or obliges and is polite by yielding personal preferences; it may represent mere fawning, but generally does not. See genteel.

politician (pol-i-tish'an), n. and a. [Formerly also politician, politician; < F. politicien, a politician; as politic + -ian.] I. n. 1. One who is versed in the science of government and the art of governing; one who is skilled in politics.

The first polititiens, dealising all expedient meanes for th' establishment of Common wealth, to hold and containe the people in order and duety. Puttenham, Arte of Eng. Poesie, p. 5.

He is the greater and deeper *politician* that can make other men the instruments of his will and ends.

Bacon, Advancement of Learning, il. 169.

2. One who occupies himself with politics; one who devotes himself to public affairs or to the promotion of the interests of a political party; one who is practically interested in politics; in a bad sense, one who concerns himself with public affairs not from patriotism or public spirit, but for his own profit or that of his friends, or of a clique or party.

This is the masterpiece of a modern politician, how to qualify and mould the sufferance and subjection of the people to the length of that foot that is to tread on their necks; how raphic may serve itself with the fair and honourable pretences of public good; how the puny law may be brought under the wardship and control of lust and will: in which attempt if they fall short, then must a su-

perficial colour of reputation by all means, direct or indirect, he gotten to wash over the unsightly bruise of honour.

Milton, Reformation in Eng., ii.

A politician, where factions run high, is interested not for the whole people, but for his own section of it.

Macaulay, Hallam's Const. Hist.

A sincere Utilitarian, therefore, is likely to be an eager olitician. II. Sidgwick, Methods of Ethics, p. 459.

3t. A politic or crafty person; a petty and generally an unscrupulous schemer; a trickster.

The Diuell . . . was noted . . . to be a greedle pursuer of news, and so famous a politician in purchasing that Hel, which at the beginning was but an obscure village, is now become a huge citie, wherento all countreys are tributarie.

Nashe, Pierce Penilesse, p. 9.

The publician, whose very essence lies in this, that he is a person ready to do any thing that he apprehends for his advantage, must first of all he sure to put himself into a state of liberty as free and large as his principles, and so to provide elbow-room enough for his conscience to lay about it, and have its free play in.

South, Sermons (1787), I. 324.

Pot-house politician, a politician of low sims and mo-tives; a professional politician, ignorant, irresponsible, and often venul: so called from the favorite resorts of such nen.=Syn. 1 and 2. This word has degenerated so as gen-erally to imply that the person busics himself with parti-sanship, low arts, and petty management, leaving the enlightened and high-minded service of the state to the statemen. A man, however, would not properly be called a statemen unless he were also of eminent ability in pub-

politicly (pol'i-tik-li), adv. In a politic manner;

politically (cunningly, politico, a politico, n. [< Sp. politico = It. politico, a politician: see politic, n.] A politician; hence, one whose conduct is guided by considerations of policy rather than principle.

He is counted cunning, a moore politice, a time-server,

an hypocrite.

Bp. Gauden, Tears of the Church, p. 256. (Davies.) politics (pol'i-tiks), n. [Early mod. E. politicks, polytykes; pl. of politic (see-ics).] 1. The seience or practice of government; the regulation and government of a nation or state for the preservation of its safety, peace, and prosthe preservation of its safety, peace, and prosperity. Politics, in its widest extent, is both the science and the art of government, or the science whose subject is the regulation of man in all his relations as the member of a state, and the application of this science. In other words, it is the theory and practice of obtaining the ends of civil society as perfectly as possible. The subjects which political science comprises have been arranged under the following heads: (1) natural law; (2) abstract politics—that is, the object or end of a state, and the relations between it and individual citizons: (3) political economy; (4) the science of police, or municipal regulation; (5) practical politics, or the conduct of the immediate public affairs of a state; (6) history of politics; (7) history of the political systems of foreign states: (8) statistics; (9) positive law relating to state affairs, commonly called constitutional law; (10) practical law of nations; (11) diplonney; (12) the technical science of politics, or an acquaintance with the forms and style of public business in different countries.

Hence the stress which Utilitarians are apt to lay on social and political activity of all kinds, and the tendency which Utilitarian ethics have always shown to pass over into politics.

Il. Sidqueick, Methods of Ethics, p. 469.

Machavelli . . . founded the science of politics for the modern world by concentrating thought upon its fundamental principles.

Energy Brit., XV. 150.

2. In a narrower and more usual sense, the art or vocation of guiding or influencing the policy of a government through the organization of a party among its citizens—including, therefore, not only the ethics of government, but more especially, and often to the exclusion of ethical principles, the art of influencing public opinion, attracting and marshaling voters, and obtain-.

ing and distributing public patronage, so far as the possession of offices may depend upon the political opinions or political services of individuals; hence, in an evil sense, the schemes and intrigues of political parties, or of cliques or individual politicians: as, the newspapers were full of politics.

When we say that two men are talking politics, we often nean that they are wrangling about some mere party ques-lon. F. W. Robertson.

I always hated politics in the ordinary sense of the word, and I am not likely to grow fonder of them.

Lowell, Biglow Papers, 2d ser., Int.

3. Political opinions; party connection or preforence.

Politics, like religion, are matters of faith on which reason says as little as possible. Froude, Sketches, p. 85.

nee, characterized by six thick, flat, ovate or

narrow petals, and numerous carpels each with narrow petals, and numerous carpets each with only one or two ovules. The 40 species are natives of tropical Asis, tropical and southern Africa, and Australasia. They bear obliquely feather, velned alternate leaves, and solitary or clustered flowers, followed by globoses or oblong one-seeded stalked herries. See mast-tree, 2. polyandris (pol-i-nn'dri-ii), n. [NL.: see polyandry.] 1. Same as polyandry.—2. [cap.] [Used as a plural.] In bot., according to the

Linnean system, a class of hermaphrodite flow-ering plants having more than twenty hypogynous stamens of equal length, free from each other and from the pistils.

polyandrian (pol-i-an'dri-an), a. [< polyandry

+ -an.] Same as polyandrous.

polyandric (pol-i-an'drik), a. [= F. polyandrique = Pg. polyandrice; as polyandry + -ic.]
Relating to or characterized by polyandry.
Also polyandrous. Westminster Rev., April, 1868,

polyandrion (pol-i-an'dri-on), n.; pl. polyandria (-ii). [\langle Gr. $\pi o \lambda v a v b r o v \rangle$, n, p, p a g a n a r o v, n place where many assemble, neut. of $\pi o \lambda v a v b r o v$, with many men, \langle $\pi o \lambda v c$, many, + a v a v b r o v, man.] In Gr. antiq. and archwol., a monument or a burial inclosure provided by the state for a number of men, usually for those of its citizens who had fallen in a battle. The famous "Lion of Cheroneas" which stood within the burial inclosure of the Thebans who died in the battle with Philip of Macedon, SSS a. c., was a monument of this class; and this was itself a close copy throughout of that recently excavated at Thesplas, which is believed to have commemorated the Thesplans who fell at Platea, 479 B. c.

polyandrious (pol-i-an'dri-us), a. In bot., same BE voluandrous

polyandrist (pol-i-an'drist), n. [< polyandr-y

polyandrist (pol-1-an' drist), n. [ζ polyandr-y + -ist.] One who practises polyandry. polyandrous (pol-i-an' drus), a. [ζ Gr. πολίαν-δρος, with many men, LGr. with many husbands, ζ πολίς, many, + ἀνήρ (ἀνδρ-), man, male (in mod. bot. stamen).] 1. In bot.: (a) Belonging to the Linnean class Polyandria. (b) Having the

the linnean class Posyanaria. (b) Inving the stamens indefinitely numerous, at least more than ten.—2. In zoöl., having several male mates; polygamous, as a female animal.—3. In sociology, same as polygandric.

polyandry (pol-i-an'dri), n. [= F. polygandric = Sp. poliandria = Pg. polygandria = It. poliandria, ζ LG. πολιανδρία, taken in sense of a condition of having many husbands' (in bot. stamens) found in sense of 'a condition of having many foundition stamens), found in sense of 'a condition of having many men, populousness,' (πολιανόρος, having many men: see polyandrous.] The state of having more husbands than one at the same having more husbands than one at the same time; plurality of husbands. Polyandry is believed to have had its origin in unfertile regions, in an endeavor to check the undue pressure of population on the means of subsistence. It formerly prevalled to some extent in Europe, and is now observed in Tibet, Ceylon, parts of India, among certain tribes in America and the islands of the Pacific, etc. It is sometimes limited to the mar-riage of the woman to two or more brothers.

In the one type, called by McLennan Nair polyandry, the woman remains with her own kin, but entertains at will such sultors as she pleases.

W. R. Smith, Kinship and Marriage, p. 122.

polyangular (pol-i-ang'gū-liir), a. [(Gr. πολίς, many, + L. angulus, an angle: see angular.] Having many angles.

polyantheat, n. Same as polianthea.

Polyanthes (pol-i-an'thez), n. See Polianthes.

polyanthous (pol-i-an'thus), a. [< NI., polyanthus, < Gr. πολιανθος, alsο πολιανθός, much-blossoning, having many flowers, \(\lambda \omega \cdot i c\), many, \(\phi \omega \omega \omega c c\), a flowers. Bearing many flowers. Thomas, Med. Diet.

polyanthus, polyanthos (pol-i-an'thus, -thos), n. [NL., < Gr. nolicother, having many flowers: see polyanthous.] A garden variety of Primula veris, most nearly allied to the variety clatter, the oxlip, whose flowers are umbeled on a common peduncle several inches high. It is an old garden favorite, which has passed through countless subvarieties. Florists require that a good polyanthus should possess a strong scape, a well-filled truss, a corolla with a short tube, a bright-yellow eye, and a deep, rich brown-crinson limb, bordered with a well-defined yellow edging. See primrosc.—Polyanthus Narcissus. See

polyarchist (pol'i-är-kist), n. [< polyarch-y + -isi.] One who favors polyarchy.

Plato . . . was no polyarchist, but a monarchist, an assertor of one supreme God.
Cudworth, Intellectual System, p. 408.

polyarchy (pol'i-är-ki), n. [= F. polyarchie = Sp. poliarquia = Pg. polyarchia = It. poliarchia, ζ Gr. πολιαρχία, the government of many, ζ πολίς, many, + ἀρχειν, rule.] Λ government by many, whether by a privileged class (aristocracy) or by the people at large (democracy); any government by several rulers.

Yet he [Aristotle] absolutely denied πολυποιρανίην, and πολυπρχίαν, a polyarchy or mundane aristocracy: that is, a multiplicity of first principles and independent detties.

Cudworth, Intellectual System, II. 83.

polyarsenite (pol-i-ür'se-nīt), n. [$\langle Gr. \pi o \lambda i c, miny, + E. arsen(ic) + -ite^2$.] In mineral., same as sarkinite.

polyarthritis (pol"i-är-thri'tis), n. [NL., < Gr. πολις, many, + NL. arthritis, q. v.] Arthritis

πολίς, many, + NL. arthritis, q. v.] Arthritis involving a number of joints.

polyarthrous (pol-i-ür'thrus), a. [⟨ Gr. πολίς, many, + ἀρθρος, a joint.] Having many joints or jointed parts; multiarticulate.

polyarticular (pol'i-ür-tik'ū-liir), a. [⟨ Gr. πολίς, many, + L. articulus, a joint: see articulur.] Pertaining to a number of joints: as,

polyarhealar rheumatism.

polyatomic (pol'i-a-tom'ik), a. [= F. polyatomique; ζ (ir. πολίνς, many, + άτομον, atom: see atom, atomic.] In chem., noting elements or radicals which have an equivalency greater than two; also, noting compounds having three or more hydroxyl groups, in which hydrogen is casily replaceable by other elements or radicals without otherwise changing the structure of the original compound: thus, glycerol is a polyatomič alcohol.

polyantography (pol'i-û-tog'ra-fi), n. [ζ Gr. πολις, many, + aντός, self, + - γραφία, ζ γράφεν, write. Cf. autography.] The act of multiplying copies of one's own handwriting or of manuscripts, as by printing from stone: a form of

lithography.

polyaxial (pol-i-ak'si-al), a. [(Gr. πολές, many, + l. axis, axis, + -al.] Having several axes. polyaxon (pol-i-ak'son), a. and a. [NL., (Gr. πολές, many, + ἀξων, axis.] I. a. Having several or many (more than six) axes of growth, the control of as a sponge-spicule; polyaxial, as the form of spicule known as a sterraster.

spicific known is a karraster.

II. n. A polyaxial sponge-spicule.

polybasic (pol-i-bū'sik), a. [= F. polybasique; $\langle \text{ (ir. } \pi o \lambda v c, \text{ many, } + \beta \delta m c, \text{ base: see } b a s v c.} \rangle$ basic.] In chem., capable of combining with more than two univalent bases: as, polybasic acids or radicals.

polybasicity (pol"i-bū-sis'i-ti), n. [\(\text{polybasic} + -ity. \)] The character or property of being

polybasite (pō-lib'n-sīt), n. [= F. polybasite; ⟨ tir. πολία, many, + βάσιε, base, + -ite².] An iron-black ore of silver, consisting of silver. sulphur, and antimony, with some copper and

arsonic. **Polybia** (pō-lib'i-ii), n. [NL. (St. Fargean, 1836), ζ (Ir. $\pi o \lambda i g i g$, with much life, $\zeta \pi o \lambda i g$, much, $+ \beta i g$, life.] A genus of hymenopterous insects of the family Fespidic, or wasps, resembling Polistes closely, but differing in the shape of the oblique of the shape of the abdomen. The species are all Central or South American except P. facilarsia, which is found in Califor-nia. P. palmarum is the palm-wasp, so called because it makes its nests on palms.

Polyborina (pol'i-bō-rī'nē), n. pl. [NL., < Polyborus + -tuæ.] A subfamily of Falcondæ, typified by the genus Polyborus, and including the genera Phalcobænus, Sencx, Milvago, Ibyeter, and Daptrius: the caracaras, or American vulture-hawks. There is a coracoclavicular articula-tion, a contric mail tubercle, an anterior pulatal keel, and a superorbital shield, in which respects the *Polyborine* re-semble falcous; but the external aspect is rather that of vultures. The bill is toothless, and the sternum is single-notched. See cuts under caracara and Ibyeler.

polyborine (pol'i-bō-rin), a. Of or pertaining

to the Polyborina.

Polyborus (pö-lib'ō-rus), n. [NL. (Vieillot, 1816), ζ Gr. πολυβορος, much-devouring, ζ πολύς, much, + βορος, gluttonous.] The typical genus of the subfamily Polyboring; the caracaras

proper. There are several species, of temporate and tropleal America, as P. cherivay, P. auduboni, and P. tutosus. See cut under caracara.
polybrachia (pol-i-brū'ki-ji), n. [NL., < Gr. #0215, many, + L. brachium, properly bracchium, the arm: see brachium.] In teratol., the presented

the arm: see brachium.] In teratol., the presence of supernumerary arms.
polybrachus (pō-lib'rā-kus), n.; pl. polybrachi
(-ki). [NL.: see polybrachia.] In teratol., a
monster with supernumerary arms.
polybranch (pol'i-brangk), a. and n. [⟨ Gr.
τολί, many. + βράχνα, gills.] I. a. Having
many gills or numerous branchiae, as a mollusk
or crustacean; of or pertaining to the Polybranchia or Polybranchiata. Also polybranchiate.
II. n. A polybranch mollusk or crustacean.
Polybranchia (pol-i-brang'ki-li), n. pl. [NL.:
see polybranch.] 1. In J. E. Gray's classification (1821), one of two orders (the other being

Pygobranckia) of nudibranchiate gastropods, having lamellar or plumose gills on the upper surface of the mantle, and containing the families Tritoniada, Scyllaida, and Tethyada.—2. In later systems, a suborder or superfamily com-prising the same forms, but subdivided among numerous families: same as *Polybranchiata*, 1. polybranchian (pol-i-brang'ki-an), a. and n.

polybranchian (pol-i-brang'ki-an), a. and a. Same as polybranch.
Polybranchiata (pol-i-brang-ki-a'tä), n. pl. [NL.: see polybranchiate.] 1. A suborder or superfamily of nudibranchiate gastropods, characterized by the dovelopment of dorsal gill-like appendages variously distributed, but never disposed in a rosette round the anus. It comprised numerous species, classified by modern malacologists among 12 to 15 families. Also called Polybranchia.
2. In De Blainville's classification (1825), one of five orders of his second section of Paraccolumbulary managing summetries, company of

of five orders of his second section of Paracephalophora monoica symmetrica, composed of the two families Tetracerata and Dicerata.

polybranchiate (pol-i-brang'ki-āt), a. [⟨NL. polybranchiatus, ⟨Gr. πολίς, many, + βράγχια, gills.] Same as polybranch.

polycarpellary (pol-i-kär'pe-lä-ri), a. [⟨Gr. πολίς, many, + NL. carpellum, carpel: see carpel, carpellary.] In bot., composed of two or many carpels. Compare monocarpellary.

nany carpels. Compare monocarpettary.

polycarpic (pol-i-kär'pik), a. [\(\) polycarp-ous + -ic.] In bot., producing fruit many times or indefinitely: applied by De Candolle to peremial herbs. Compare monocarpous (a).

emial herbs. Compare monocarpous (a). Polycarpon (pol-i-kār'pon), n. [NL. (Linnœus, 1737), so called in allusion to the many little fruits (cf. L. polycarpon, < Gr. πολίκαρπος, with much fruit, fruitful: see polycarpous.] A genus of diffuse polypetalous herbs of the order Caryophylleæ, type of the tribe Polycarpeæ, and characterized by the five keeled and entire sepals, the five small entire hyaline petals, the three to five stamens, and the one-celled evary with many cynles. crowned with a short threewith many ovules, crowned with a short three cleft style, and becoming a small three-valved cleft style, and becoming a small three-valved enpanle. There are 6 species, generally diffused throughout temperate and warmer regions. They are shender an unals, bearing opposite ovate or oblong flat leaves, dry and thin bracts and stipules, and very numerous densely compacted little whitish flowers in much-branched cymes. From the great quantity of its seed, the European species, P. tetraphyllum, is called allosed.

polycarpous (pol-i-kir'pus), a. [< (ir. πολίτ-καρπος, with much fruit, fruitful, < πολίτ-καρπος, fruit.] In hot, having a cynaccium

+ καρπός, fruit.] In bot., having a gynaeium composed of two or more distinct ovaries or carpels. Compare monocarpous, and cuts un-der carpel and gynobase.

polycellular (pol-i-sel' ŭ-lär), a. [ζ Gr. πολές, many, + Ni.. cellula, a cell: see cellular.] In bot., containing or composed of many cells. polycentric (pol-i-sen'trik), a. [ζ Gr. ποὐτς, nany, + κέντρον, point: see center¹.] Having several centers or nucleal points.

But a complexity is introduced as soon as the sap-vacuoles appear, in many cases making the cell not monocentric but polycentric.

II. Marshall Ward, Nature, XXXV. 301.

Polycentridæ (pol-i-sen'tri-dé), n. pl. [NL., \ Polycentrus + -idw.] A family of acanthop-terygian fishes, typified by the genus Polycenterygian fishes, typified by the genus Polycentrus. They have a symmetrical compressed body without lateral line, compressed head with very projectife jaws, a long dorsal and anal fin with many spines, and perfect ventrals. The family contains a few South American fresh-water fishes, somewhat related to the centrarchoids of North America. In Günther's classification it was referred to the Acauthopterygii perciformes.

Polycentrus (pol-i-sen'trus), n. [NL. (Müller and Troschel, 1848), < Gr. ποδίς, many, + κίντρον, point: see center!] The typical genus of Polycentrida: so called from the many spines, especially of the anal fin.

polycephalist (pol-i-sef's-list), n. [⟨ Gr. ποδικάρολος, having many heads (see polycephalous),

κέφαλος, having many heads, many-headed, πολίες many, + κεφαλή, head.] In bot., bearing or consisting of many heads. Polycera (pō-lis'e-rā), n. [NL., < Gr. πολύκερως, many-horned, < πολίες, many, + κέρας, horn.]

Polycera quadrilineata. (Line shows natural size.)

The typical genus of *Polycerids*. A true representative species is *P. quadritinents* of Europa. *P. lessons* is a beautiful sea-slug of a pale ficah-color marked with green and yellow, found in the North Atlantic ocean, referred by some to a distinct genus *Patio*.

Polycaridæ (pol-i-ser'i-dé), n. pl. [NL., < Polyceru + -idæ.] A family of phanerobranchiate doridoid gastropoda having a simple pharyngeal doridoid gastropous naving a simple pharyngea; bulb, typified by the genus Polycera. The branchis are not retractile, the labial armature is variable, and the radula is narrow. The species are numerous, and have been grouped by some under three or more subfamilies, elevated by others to family rank.

Polycheta (pol-i-kē'tii), n. pl. [NL., neut. pl. of polychetus: see polychetous.] An order or other group of chestopodous annelids, having the body segmented, the false feet or parapodia with many chestes, setse, or bristles (whence the name), and the head tentaculate; the polychename), and the head tentaculate; the polychectous worms. It is a very large group, of numerous families, including a majority of the annelids, as all the sedentary or tubleolous and the errant marine worms. It is contrasted with the order Oligocheta. See cuts under eigerum, Polynos, Protula, esrebral, esophageal, prestomius, and phydatum.

polycheste (pol'i-kōt), a. Same as polychectous.

polychestous (pol-i-kō'tus), a. [< NL. polychectus, < Gr. πολυχαίτης, with much hair, < πολύς, many, + χαίτη, long hair, mane: see cheta.]

See polychromatic acid, under polychromatic.—Polychromatic process, a carbon photographic process invented by Vidal, analogous to chromolithography in method and object. The first step is to make from the subject as many negatives

as there are colors to be represented, each of these being appropriated for a particular tint, while all parts otherwise tinted in the original are masked on the negative with an opaque pigment. Gelatin plotures of the required tints are then prepared from the negatives, and superimposed in turn by a system of registration over a print of the whole subject previously made with a neutral ground, thus completing the polyohromatic picture. This process gives strikingly naturalistic results in the reproduction of goldsmiths work, enamels, mosaics, etc.

polychromy (pol'i-krō-mi), n. [= F. polychromic, ζ Gr. as if *πολυχρομία, ζ πολείχρομος, many-colored: see polychrome.] Decoration or execution in many colors; specifically, the practice of coloring more or less completely statues and the actions of buildings. of coloring more or loss completely statues and
the exteriors and interiors of buildings. This
practice dates from the highest antiquity, and reached its
greatest artistic perfection in Greece, where it was consistently applied to all sculpture and architecture. In archaic
examples the coloring was the most complete and strong,
and in the case of sculpture was to a great extent conventional—men's flesh, for instance, being colored deep-brown
or red, and women's white or yellowish. In the architecture of the best time, while surfaces of considerable extent ture of the best time, while surfaces of considerable extent were still brilliantly colored, as in red or blue, the chief part of many features, as of columns, was left in the natu-ral color of the marble, or perhaps merely slightly tinted, and discreetly set off with meanders or other ornamenta in gfiding or strong color. Throughout Europe, during the twelfth and thirteenth centuries, architectural polychromy was employed with admirable effect.

Polychrus (pol'i-krus), n. [NL. (Cuvier, 1817), < (ir. πολύς, many, + χρώς, color of the skin, complexion.] 1. polycotyledon + -y3.] In bot., an aberrant increase in the number of cotyledons, as in Cola

acuminata, where they vary from two to five.

polycracy (pō-lik'rū-si), n. [⟨ Gr. πολίε, many, + -κρατία, ⟨κρατεῖν, rule.] Government by many rulers; polyarchy.

polycrase (pol'i-krūz), n. [⟨ Gr. πολίε, many, the control of the co

+ *pāσι, a mixing: see crasis.] A rare titano-niobate of uranium, the metals of the yttrium group, and other bases: it is found in Norway, and also in North Carolina.

polycrotic (pol-i-krot'ik), a. [⟨Gr. πο²iε, many, + κρότες, a rattling noise, beat. clash: see dicrotic.] Having several beats; having several

crotic.] Having soveral beats; having soveral secondary waves: said of some pulses.

Polyctenes (pō-lik'te-nēz), n. [NL. (Westwood; Giglioli, 1864), < Gr. πολίς, many, + κτιές (κτεν-), a comb.] A genus of true lice, typical of the family Polyctenidæ. The head is armed beneath with rows of long flat spines, whence the name. The species are parasites of bats in Jamaica and China, and doubtless elsewhere. This remarkable form has been of disputed location, being by some referred to the pupiparous dipterous insects.

Polyctenidæ (pol-ik-ten'i-dē), n. pl. [NL., < Polyctenes +-dæ.] A family of true lice, or Hemisptera parasitica, represented by the genus Polyctenes. Westwood, 1874.

polycyclic (pol-i-sik'lik), a. [< Gr. πολίπωκλος, with many circles, < πολίς, many, + κίπλος, a ring, circle.] Having many rounds, turns, or

ring, circle.] Having many rounds, turns, or whorls, as a shell.

polycystic (pol-i-sis'tik), a. [⟨Gr. πολίς, many, + κίστις, a bag: see cyst.] Having many cysts or sacs, as a tumor.

or sacs, as a tumor.

Polycystida (pol-i-sis'ti-dž), n. pl. [NL., < Gr. πολίς, many, + κίστις, bag (see cyst), + -ida.]

A family of Nussellaria. The skeletoris as irregular fenestrated shell, composed of several unequal chambers, piled usually irregularly (rarely in definite order varying from that of the Cystides) round a primary capitulum (derivable from the twin shell of the Sphyroide), with or without spicules.

polycystidan (pol-i-sis'ti-dan), a. and u. I. a.

Of or pertaining to the *Polycystida*.

II. v. A member of the *Polycystida* Polycystina (pol'i-sis-ti'n#), n. pl. [NL., ζ Gr. πολη, many, + κιστης, bag (see cyst), + -ina².] Ehrenberg's name (given by him in the form Polycistina) of all those radiolarians which were known to him: loosely synonymous with

polycystine (pol-i-sis'tin), a. and u. I. a. Of or pertaining to the *Polycystina*: now noting one of the divisions of *Radiolaria*.

II. n. A member of the Polycystina. polycythemia (pol'i-sī-thơ'mi-ii), μ . [NL. polycythæmia, \langle Gr. $\pi o i i \epsilon$, many, + $\kappa i \tau o \epsilon$, a hollow (cell), + $a i \mu a$, blood.] Excess of red corpuscles in the blood

Polycyttaria (pol'i-si-tū'ri-ji), n. pl. [N1.., ζ Gr. πολίς, many. + κετταρος, a cell, ζ κέτος, a hollow.] A fumily or other group of Radiolaria, containing compound or colonial forms having many central capsules connected by extracapsular protoplasm; the polycyttarian radiolarians. The capsules are multinuclear, multiplying by fission, and the skeleton is spherical and fenestrated or composed of loose spicules, or absent. Leading forms are Collombarn, Spharnezonn, and Collomon. Also called

polycyttarian (pol'i-si-tā'ri-an), a. and n. Gr. $\pi o \lambda i \varphi$, many, + $\kappa i \tau \tau a \rho o \varphi$, a cell, + -i a n.] I. a. Having several central capsules; pluricapsular, as a radiolarian; of or pertaining to the Polycuttaria.

, n. A member of the Polycyttaria polydactyl, polydactyle (pol-i-dak'til), a. and n. [⟨Gr. πολυάκτυλος, many-toed, ζπολις, many, + δάκτυλος, a finger, a toe: see dactyl.] I. a. Having many digits, whether fingers or toes; exhibiting or characterized by polydactylism.

[Nl., < Gr. as if "πολοδιψία, great thirst, < πολιδιψία, very thirsty, πολιδιψία, making very thirsty, < πολίς, much, + δίψα, thirst.] In pathol., excessive thirst. It is usually accompanied by hydruria.

polydromic (pol-i-drom'ik), a. Same as poly-

polydymite(poʻlid'i-mīt), n. A sulphid of nickel, occurring in isometric octahedrons and in massive forms, of a light-gray color and brilliant metallic luster. A ferriferous variety from Ontario carries a small amount of platinum. polyedral, polyedron, etc. Same as polyhedral,

polyembryonate (pol-i-em'bri-ō-nāt), a. [As polyembryon-y + -atr1.] In boi., pertaining to polyembryony; consisting of or having several embryos.

polyembryonic (pol-i-em-bri-on'ik), polyembryone (pol-tem-priority, a. [As polyembryonate, polyembryony (pol-tem'lpri-q-ni), n. [ζ Gr. πολύς, many, + ἐμβρου, an embryo: see embryo.] In bot., the production or existence of two or more embryos in one seed - a phenomenon occurring, sometimes regularly and sometimes abnormally, in the development of the ovules of normally, in the development of the ovules of flowering plants. In angiospermous plants several germinal masses usually occur in the unfertilized embryosac, but in most cases only one of these is impregnated, and, although occasionally more than one commence the course of development, as in the Orchidez, generally all but one become subsequently obliterated. In the orange, however, this is not the case, and its ripe seeds are met with containing more than one embryo.

polyemia, n. See polyhemia.
polyemic (pol-i-er'jik), a. [⟨ Gr. πολίνργος,
much-working, ⟨ πολίν, much, + έργον, work.]
Acting, or endowed with the power of acting, in many ways.

Polyergus (pol-i-ér'gus), n. [NL. (Latreille, 1802), ζ Gr. πολίπργος, much-working, ζ πολίς, much, + iργον, work.] A genus of Formicids, having the mandibles almost cylindrical. curved, very narrow, and acute at the tip, ocelli present, and the wings of the female with only present, and the wings of the female with only one discoidal cell; the Amazon-ants. Two species are found in the United States, but most are tropical or subtropical. P. rufescen is a slave-making ant which has lost the building instinct and shows no care for its young, and in which the mandibles have lost their toeth—all as a result of their entire dependence upon slaves.

There are about 200 species, natives of temperate and warm regions, widely prevalent except in Australia. They

are small herbs or sometimes shrubby plants, insually with alternate leaves, and terminal spikes of small or showy flowers of red, yellow, green, white, and other colors. Several cultivated purple-flowered species from the Cape of Good Hope are overgreen shrubs reaching 9 feet in height. P. lutes of the southern United States is known locally as backelor's.buttons. P. panofolia, another handsome species, is the fringed polygals or flowering wintergreen of the United States; this and P. palygama of the Atlantic States are remarkable for their two kinds of flowers, having crimson or purple open flowers above ground, and also abundant white or green unexpanding but fertile subterranean flowers on slender white branches. The root of P. Senega is a stimulating expectorant and diuretic, and Jn large doses cathartic and emetic. It is called senega in medicine. (See senega-root.) P. the sisten is the chinchin of Chill. a powerful diuretic, and P. renenosa, the katu-tutum of Java, is poisonous to the touch. Many species are claimed as remedies against snake bites, as P. sanguinea and P. purpures, common reddish-flowered plants of the United States, and others in the West Indies, Cape Colony, and the Himalayas. For P. vulgaria, also sometimes called procession-flower or passion-flower, see milkwort, cross-flower, gang-flower, and repation-flower. 2. [I. c.] A plant of this genus.

polygalaceous (pol'i-gā-lā'shius), a. [< Polygalaceu + -ous.] Of or pertaining to the Polyualese.

Polygales (pol-i-ga'la-e), n. pl. [NL. (Jussieu, 1869), < Polygalu + -cs.] An order of polypetalous plants, unlike the others in the cohort Polygaling in its irregular flowers, and characterized by its three or five petals, usually eight monadelphous stamens, straight embryo in fleshy albumen, and five sepals, of which the two inner are larger, wing-like, and petaloid. The fruit is either a capsule or a dry or fleshy indehiscent fruit. The order is without close affinity, but often shows in its keeled flowers a superficial resemblance to the Lepunsinose or bean family. It includes about 470 species, widely dispersed throughout temperate and warm climates, belonging to 16 genera, of which Polygnal is the type. They are herbs or undershruis, rarely becoming small trees, erect or sometimes twining or climbing, with usually entire alternate leaves, and solitary, spiked, or racemed flowers. eight monadelphous stamens, straight embryo

Polygalinæ (pol'i-gā-li'nē), n. pl. [NL. (Bentham and Hooker, 1862), < Polygala + -inæ.]

A cohort of polypetalous plants of the series
Thalumifloræ, characterized by an ovary of two cells or carpels, many horizontal ovules or a single pendulous one, fleshy albumen, and ab-

single pendulous one, nearly arotimen, and absence of stipules. It includes 3 orders, of which the Pittoporum and Tremaudra families are small groups of Australian shrubs, while the Polygala family (the type) is of nearly universal distribution.

polygaline (pô-lig'a-lin), n. [= F. polygaline; as Polygala + -ine².] A substance obtained from Polygala Senega, apparently identical with suponin. Also called polygalic acid and sencain.

polygam (pol'i-gam), n. [< Polygam-ia.] A plant of the Linnean class Polygamia.

Polygamia (pol-i-gā'mi-μ), n. μl. [NL., < Gr. πολυγαμος, polygamous: see polygamous.] In the Linnean system of classification, a class of πολεγαμος, polygamous: see polygamous.] In the Linnean system of classification, a class of plants bearing both hermaphrodite flowers and those with the sexes separated, the different showers being scattered either on the same plant or on two or three distinct individuals.

polygamian (pol-i-gū'mi-an), a. [< Polygamia +-an.] Belonging or relating to the Polygamia; producing hermaphrodite flowers, and also male or female flowers, or both.

polygamist (po-lig's-mist), n. [= Pg. polygamista; as polygam-y + -ist.] A person who practises polygamy, or who maintains its propriety.

polygamize (po-lig'a-mīz), v. i.; pret. and pp. polygamize (po-lig'a-miz), v. t.; pret. and pp. polygamized, ppr. polygamizing. [< polygam-y + -ize.] To practise polygamy. Sylvester, tr. of Du Bartas's Weeks, ii., The Handy-Crafts. polygamodiocious (pō-lig"a-mō-di-e'shus), a. [< LGr. πολύγαμος, polygamous, + NL. diweius, diocious.] Same as diociously polygamous.

See polygamous, 3. polygamous (po-lig'a-mus), a. [= F. polygamo = Sp. polygamo = Pg. polygamo = It. polygamo, = Sp. potsgamo = Fg. potsgamo = 1t. potsgamo, polygamous, a polygamist; < LGr. πολίγαμος, often-married, polygamous, < Gr. πολίς, many, + γάμος, marriage.] 1. Relating to or characterized by polygamy: as, polygamous marriage (a union including more than one spouse of either sex, sanctioned in respect to plurality of wives by the law of some countries, but not recognized as marriage by the law of Christian states).—2. In zvöl., mating with more than one individual of the opposite sex; polyandrous or polygynous, especially the latter, which is more frequent among animals than the former.—3. In bot., bearing both unisexual and bisexual or hermaphroditic flowers in the same species.

According to the tendency to become either monest discious, they are called monastously or disciously smous respectively. In the case of monase having barren and fertile inflorescences (flowers) various posed on the same plant, polygemous is also us

Marriage with more than one spouse; the having of a polygamia of the polygamia of the polygamia. plurality of wives or husbands at the same plurality of wives or husbands at the same time. In Christian countries, when a man has more wives than one, or a woman more husbands than one, at the same time, he or she is punishable for polygamy; but if there was a separate marriage with each the first marriage would be valid notwithstanding the subsequent ones, and the later ones would be void. The offense of contracting the subsequent marriage is now termed bigamy. But polygamy in the form of polygyny is allowed in some countries, especially among highermodans, and was held a matter of faith and duty by the Mornoon. Compare polygandry.

2. In zoöl, the practice or habit of having more than one mate of the opposite sex; polygandry.

than one mate of the opposite sex; polyandry than one mate of the opposite sex; polyandry or polygyny. In mammals, polygamy is the rule with pinniped and various other carnivorous quadrupeds, with the hoofed quadrupeds in general, and in many other groups, especially in its polygynous form. In the class of birds, where monogamy is the rule, polygamy is conspicuous in the rasorial or gallinaceous order, and is exceptionally witnessed in some members of the monogamous orders, as in the cowbirds and cuckoos among passerine and picarian birds.

polygar (pol'i-gär), n. See poligar.

polygarchy (pol'i-gär-ki), n. [= F. poligarchie (Cotgrave) = Sp. poligarquia = Fg. polygarchia; an erroneous form (auder simulating olicar-

polygastric (pol-i-gas'trik), a. and n. [\langle Gr. $\pi o \lambda i \varphi$, many, $+ \gamma a \sigma \tau i \varphi$ ($\gamma a \sigma \tau \mu$ -), stomach.] I. a. Having or appearing to have many stomachs, as an animalcule; specifically, of or pertaining

to the Polygastrica.

II. n. A polygastric animalcule. Polygastrica (pol-i-gas'tri-kä), n. pl. [NL: see polygastric.] Ehrenberg's name (1830) of those animalcules the appearance of whose movable food-vacuoles led him to suppose they had many proper digestive cavities or stomachs. The term had special application to ciliate infusorians, of which it is now a disused synonym, and less exactly of Infusoria at large.

polygastrulation (pol-i-gas-trö-lä'shon), n. [⟨Gr. πολίς, many, + Ε. gastrulation.] Multiple gastrulation.

polygenesis (pol-i-jen'e-sis), n. [ζ Gr. πολές, many, + γένεος, origin: see genesis.] In biol., generation or origination from several separate and independent germs; the doctrine that or-ganisms took rise from cells or embryos of dif-

different parts.

A composite or *polygenetic* range or chain, made up of two or more monogenetic ranges combined. Amer. Jour. Sci., 3d ser., V. 429.

polygon (pol'i-gon), n. [Formerly polygone; = F. polygone = Sp. polygone = Pg. polygone = It. polygone, a polygon, polygonal, LL. polygonum, ζ Gr. πολύγωνο, a polygon, neut. of πολύγωνος, having many angles, ζ πολύς, many, + γωνία, corner, angle.] In goom., a closed figure formed by the intersections of a number of straight lines, each with two others; especially, a plane figure of this sort; a figure with numerous an-

distinct order of apetalous plants of the series Currembrycz. It is characterized by a colored or greenish calyx with four, five, or six imbricated segments, an ovary with one cell and one orthotropous ovule, two or three styles or style-branches, from six to nine perignous stamens, and stipules with each pair united into a cylindrical sheath (cores), or at least leaving, on falling away, a scar forming a complete ring around the stem. It includes about 750 species, belonging to 6 tribes and 30 genera, varying in habit according to distribution, the numerous herbaceous species being mainly in temperate or montane regions, represented by shrubs in western Asia and the Mediterraneau, and by trees in tropical America. They bear alternate and usually entire leaves, generally with dilated and clasping petiole-base. The fruit is a small seed-like nut, three-angled or compressed, and inclosed by the withering, persistent flower. Many of the species are weedy plants, especially in the large genera Rumez (dock), Eviopousus, and Polygonus (the type). The most useful genera are Facopyrum (buckwheat) and Rheum (rhubarb). See also Czyria, Coccoloba, Kanigia.

Polygonaccous (pol'i-go-fas'shius), a. In bot., like or belonging to the Polygonacce.

Polygonates (pol'i-gō-nā'tō-ō), n. pl. [NL. (Bontham and Hooker, 1883), < Polygonatum + (Bontham and Hooker, 1885), (Polygonatum + -ae.] A tribe of liliaceous plants, typified by the genus Polygonatum, the Solomon's-seal. It is characterized by a herbaseous leafy stem, nearly or quite unbranched, an inflorescence of axillary flowers or a receme, rarely a paniele, anthers intronely dehiscent, the fruit a berry, and anatropous ovules. It includes 7 genera and about 42 species. See Polygonatum, Smilacina, Maianthomam, Streptopus.

Tournefort, 1700), < 1. polygonatum, < Gr.
πολυγόνατον, Solomon's-seal (so called from the many-jointed rootstocks), < πολίς, many, + γόνν (yovar-), knee.] A genus of liliaceous plants, the Solomon's-seal, type of the tribe Polygothe Solomon's-scal, type of the tribe Polygonatew. It is characterized by the nodding cylindrical flowers, having six short little-spreading lobes, and placed one or two or rarely more together at an axil, and by the undivided style and small stigms. There are 23 spocies, widely scattered through all north temperate regions. They bear a single creet leafy stem from a horisontal thickened deep buried or creeping rootstock, which is terminated by the upturned bud for the stem of the following year, and is marked by the circular scars of previous similar stems. These seal-like impressions gave the rootstock great fame for magic powers in the middle ages, as able to seal up and heal all wounds, having been stamped with the seal of Solomon, or of the Virgin Mary, whence the popular names Solomon's-seal and Our-Lady's-seal, the former of which is still in use. (See Solomon's-seal and lady's-seal.) From its bell-like flowers, resembling a string of tintinnabula, by the monks ascribed to King David, the common English species, P. multiforum, has derived the name Pasid's-hary; also, from its upward series of leaves, ladder-to-heaven, and, from resemblances to other plants, liky-of-the-mountain and frazinell.

(Tournefort, 1700), ⟨L. polygonum, ⟨Gr. πολίγουνο, knot-grass, polygony: see polygon.] A large genus of plants, type of the order Polygonaccæ and tribe Eurolugones. It is characterized. genus of plants, type of the order *Polygonacce* and tribe *Eupolygonee*. It is characterized by a stem with swollen joints and conspicuous stipular sheaths, flowers with eight or six staniers, two or three styles, and a five-parted and commonly colored perianth, romaining with little change around the black and shining or opaque hard three-angled or compressed nutlet, which is of nearly the same length as the sepais. The species are variously estimated at 150 to 300, widely distributed, and some of them nearly or quite cosmopolitan. They are most abundant in the northern hemisphere, but also extend into arctic, alpine, and tropical regions. Although of polymorphous habit, they are easily distinguished by the swol-

len joints sheathed with the united stipules. (See cut under sode.) Nearly all are herbs, a few abrubby at the base. Some are tail and erect, as P. orientale, the prince's-feather (also called ragged-sailor); a very few are floating, some erect and aquatic, and others climbing or trailing, as P. scandens, now esteemed for baskets in greenhouses, and P. caccinifedium, the rock-knotweed, from the Himalayas, used for ornamental rockertes. The majority are, however, spreading weedy plants, especially in the section Arientaria, a group of about 50 species with wiry and short or prostrate stems, typifled by P. arienlare (see knot-grass, doorseed, and bird's-kress), also known by many other names, as allowed, armstrong, beggar-weed, cone-grass, crab-weed, pume grass, iron grass, knotwort, ninety-knot, plantseed, aparene-longue, saries is grass, etc. Another section, also of about 50 species, Pervicaria, with creet but weak and intey stems, is typified by the abundant weed P. Persicaria, the lady's-thumb, also called, from the peach-leaf shape of the leaves, persicary and prachrori, from their dark contral spot, heart's-sace and spotted knotweed, and, from the jointest stem, crub's-clau and redshanks. Several related species are known as martweed, especially P. Hydropier, also called in England redkness, ciderage, lake-need, etc., and for which see also water-pepper, culrage, and arse-smart. A related and handsome-flowered species of American river-margins, introduced into cultivation as a source of tannin, is P. amphibium, the willow-grass or water-persicaria. The general name knotweed is a book-name for many of the species. Many are mild astringents, others strongly diurotic and acid; the most important in medicine is P. Bistoria (see bistort, anakeweed, adder's-wort, astrology, and dragonownt), also known in England as redlegs, trice-writhen. Easter ledges, etc. P. Fagogyprum of many authors, the cultivated buck-wheat, is now separated (see Fagogyrum). P. tinctorium is the Chinese indige-plant, cultivated in France

polygrammatic (pol'i-gra-mat'ik), a. [As polygram + -atic² (cf. grammatic).] Pertaining or relating to polygrams... Polygrammatic telegraph, a form of semaphore invented by Captain Paley in 1804.

polygraph (pol'i-graf), n. [= F. polygraphe = Pg. polygrapho = It. poligrafo, \(\cdot\) Gr. πολυγράφος, writing much, \(\cdot\) πολύς, much, \(+\cdot\) γράφεν, write.]

1. An instrument for multiplying copies of a writing; a gelatin copying-pad... 2. An author of many works... 3. A collection of different works written either by one or by different authors; a book containing articles or treatises on thors; a book containing articles or treatises on different subjects.

polygraphic (pol-i-graf'ik), a. [= F. polygraphique = Pg. polygraphice; as polygraph + -ic.] I. Pertaining to multiplication of copies of a writing: as, a polygraphic instrument.—2. Done with a polygraph: as, a polygraphic copy

rone with a polygraphic as, a polygraphic copy or writing.—Polygraphic paper. See paper.

polygraphical (pol-i-graf'i-kal), a. [< polygraphic + -al.] Same as polygraphic.

polygraphy (pō-lig'ra-fl), n. [= F. polygraphie = Sp. polygraphia = It. poligrafia, < IAr. πολυγραφία, a writing much, < Gr. πολύς, much, + γράφειν, write.] 1. Voluminous writing nous writing.

No less admirable his [Dr. Willet's] industry, appearing in his Synopses, Comments, and Commentaries, insomuch that one, considering his polygraphy, said merrily that he must write while he slopt.

Fuller, Worthles, Cambridgeshire.

2. The art of writing in various ciphers, and also of deciphering such writings.

polygyny (pō-lij'i-ni), n. [< NL. polygynia, < Ur. *nokvywia, the condition of having many wives, κολυγύνης, πολυγύναιος, having many wives, πολύς, many, + γυνή, woman, wife.] Marriage or cohabitation of one man with more than one woman at the same time; polygamy as prac-

woman at the same time; polygamy as practised by the male. Polygyn is more frequent than polyandry, being the usual case of polygamy as practised by man and the lower animals.

polygyral (pol-i-ji'rml), α. [⟨ Gr. πολίγνρος, with many windings, ⟨ πολίς, many, + γίρος, a circle, ring: see gyre.] Having many whorls or gyres, as a univalve shell. W. G. Binney.

polyhamis, n. See polyhomia. polyhalite (pol-i-hal'it), n. [$\langle Gr. πολίς, many, + \hat{a}λξ (aλ), salt, + -ite^2.$] A mineral or salt occurring in masses of a fibrous structure, of a brick-red color, being tinged with iron. It is a hydrous sulphate of calcium, magnesium, and potassium. It is found at Ischl in Austria, and also at Berchtesgaden

polyhedra, **. Plural of polyhedron.
polyhedral (pol-i-hē'dral), a. [< polyhedron
+-al.] Having many faces, as a solid body; +-al.] Having many faces, as a solid body; of or pertaining to a polyhedron. Also polyhedric, polyhedrons, polyedrol, polyedrous.—Polyhedral function, an algebraic function which remains unchanged when the variable undergoes any of those transformations which would carry a polyhedron, stereographically projected upon the plane of an imaginary quantity, into a congruent position.

polyhedric (pol-i-hē'drik), a. [= F. polyédrique; as polyhedron + -ic.] Same as polyhedron hadral.

polyhedrometry (pol'i-hē-drom'et-ri), n. [(polyhedron + Gr. μετρία, ζ μετρείν, measure.] The system of theorems concerning the numbers of faces, edges, and summits of polyhedra, the numbers of edges belonging to the different faces and summits, and other allied matters. The name is ill formed to express this idea

polyhedron (pol-i-hē'dron), n.; pl. polyhedra, polyhedrons (-drii, -dronz). [Also polyedron; = F. polyèdro = Sp. polihedro = Pg. polyedro = It. poliedro, ζ Gr. πολιεδρον, neut. οι πολιεδρος, with many bases, $\langle \pi o \lambda e e \rho_0 \rangle$, many, $+ i \delta \rho a$, seat, base,] 1. In geom., a solid bounded by plane faces.—2. In optics, a multiplying glass or lens consisting of several plane surfaces disposed in a convex form, through each of which an object is seen; a polyscope.—3. In bot., in Hydro-dictyon or water-net, one of the special anguthe section with horn-like processes formed by the swarm-cells produced in the zygospore, within each of which a new comobium is developed. Goebel.—Conjugate polyhedra, two polyhedra each having a summit for every face of the other.—Doubly reversible polyhedron, a polyhedron which ex-

hibits, in the faces touching the base, a series repeated twice. So in a trebty researable polyhedren, etc., the series is repeated thrice, etc.—Generator of a polyhedron. See generator.—Regular polyhedron, a polyhedron that has all its summits alls its in all respects and composed of plane angles of the same magnitude: sometimes understood as excluding the stellated polyhedra. See cut under cetahedron.—Semi-regular polyhedron, a polyhedron all the summits of which are alike, while the plane angles which compose the summits are not all alike.—Stellated polyhedron, a polyhedron that inwraps its center more than once.

that property of certain compounds by virtue of which they differ in their molecular weights and in their chemical properties, though formed from the same elements, combined in the same proportion. Thus, the molecular weights of butyric acid (C₄H₆O₂) and aldehyde (C₂H₄O) are 88 and 44 respectively and their chemical properties are wholly unlike, but both contain the same elements—earbon, hydrogen, and oxygen—combined in the same proportion. See isomeries.

2. Multiplicity of parts; presence of many parts in one whole.

polymerization (pol-i-mer-i-zā'shon), n. [cpolymerize + -ation.]
The apparent fusion or union of two or more molecules of a compound, forming a more complex molecule with a higher atomic weight and somewhat different physical and chemical properties. Also spelled polyIn the quenched globule we may possibly encounter a dymerisation of the molecular structure of the annealed chule. Amer. Jour. Sol., 3d ser., XXXII. 182.

polymerize (pō-lim'e-riz), v. t. and i.; pret. and pp. polymerized, ppr. polymerizing. [\(\) polymer-ons + -ize.] To combine or eause to combine so as to form polymerides. Also spelled polymerine.

Prof. Armstrong found hydrocarbons . . . which are readily polymerised by sulphuric acid. Jour. Franklin Inst., CXXI. 172.

Polymerosomata (pol-i-mer-ō-sō'ma-til), n. pl. [NL., neut. pl. of polymerosomatus: see polymerosomatous.] In Leach's system of classification, an order of pulmonate Arachnida, sy-nonymous with Latreille's Pedipalpi, containing the scorpions and their allies, as the Thelyphonide and Phrynide: so called from the numerous flexible segments of the body, and contrasted with Dimerosomata, Monomerosomata, and Podosomata.

polymerosomatous (pol-i-mer-ō-som'a-tus), a. polymerosomatus, ζ Gr. πολίς, many, + μέρος, part, + πόμα, body.] Having the body segmented into many joints, as a scorpion; of or pertaining to the *Polymerosomatu*.

called as formerly supposed to indicate a mixture or combination of several diverse forms. There are three species, P. nobilis of Madeira, P. lowes of Cubs, and P. japonica. Also Polymizia.

Polymizidas (pol'i-mik-si'i-de), n. pl. [NL., C Polymizia + -idis.] A family of scanthoptorygian fishes, typified by the genus Polymizia, having an oblong compressed body, blunt head with a pair of barbels on the chin, long dorsal fin with three or four spines, and ventrals with a spine and six or seven rays. It contains three a spine and six or seven rays. It contains three species, inhabiting rather deep water of both the Atlantic and the Pacific.

Polymnia¹ (pō-lim'ni-ā), n. See Polyhymnia.
Polymnia² (pō-lim'ni-ā), n. [NL. (Linnæus, 1753), ⟨ Gr. Iloλύμνια, Polyhymnia, one of the Muses: see Polyhymnia.] A genus of composite plants of the tribe Helianthoideæ and subsite plants of the tribe Helianthoides and subtribe Melampodies. It is characterised by ample leaves, either opposite or alternate above, and corymbose flower-heads with broad involucres, the outer row of bracts often large, leaf-like, and spreading, the ray-flowers in a single row or lacking altogether, and smooth, thick, and nearly cylindrical obovoid achenes, without awns. The 12 species are natives of America, and are found from Canada to Buenos Ayres. They are perennial herbs, shruhs, or trees, often viscid, with yellow flowers, and large angled, lobed, or entire leaves, generally appendaged at the peti-ole-base with a cup-like membrane, whence their name leaveup.

polymnite (pol'im-nit), n. [For *polymnite, ζ Gr. πολίγανως, full of moss (ζ πολίγ, much, + μνίον, moss), + -ite².] A stone marked with dendrites and black lines, and so disposed as to represent rivers, marshes, and ponds.

polymorph (pol'i-môrf), n. [< Gr. πυλίς, many, + μορωή, form.] 1. In chem., a substance which crystallizes in two or more forms distinct from each other. See dimorphism and trimorphism .-2. In biol., an organism exhibiting or characterized by polymorphism; an individual member of a species or other group which differs from other members of the same group to an unusual degree.

Polymorphi (pol-i-môr'fi), n. pl. [NL., pl. of polymorphus: see polymorphous.] One of the six main divisions of Braconidz, a family of hymenopterous parasites, including those subfamilies in which the clypeus fits closely to the mandibles and the second submarginal cell of the fore wings is large, quadrangular, or wanting. It includes 12 subfamilies and many gen-

Polymorphininm (pol-i-môr-fl-nī'nē), n. pl. [NL., < Polymorphina + -inæ.] A subfamily of Lagenidæ, typified by the genus Polymorphina, having the cells of the test arranged prirally or irregularly around the long axis, or (rarely) biscrial and alternate.

biserial and alternate.

polymorphism (poli-mor/fizm), n. [= F. polymorphisme; as polymorph-ous + -ism.]

1. The property of being polymorphous, or capable of existing in different forms; specifically, in crystall, the property of crystallizing in two or more fundamental forms: thus, carbon crystallizes in isometric forms in the diamond, and in hexagonal forms in graphite. When the substance assumes two forms it is said to be disnorphic, or to present the phenomenon of disnorphion; when three, it is said to be trimorphic.
2. In zoöl.. difference of form, structure, or

type; existence in, or exhibition by, a group of animals, as a species, genus, family, or order, of different types of structure; heterogeneous-

A considerable number of what have been classed as varieties are really cases of pulymorphism.

A. Il. Wallace, Nat. Select., p. 145.

A. 16. Watter, Nat. Scient, p. 140.

New complications of structure among the Hydromeduses are summed up under the head of polymorphins.

The differentiation of hydriform and medualform persons is a case of dimorphism; a further distribution of functions, with corresponding modification of form, gives us polymorphism.

Energe. Brit., XII. 554. 3. In bot., the comprisal of numerous definite

3. In bot., the comprisal of numerous definite or indefinite subtypes under a given type.

polymorphous (pol-i-mor'fus), a. [= F. polymorphe = Pg. polymorpho = lt. polimorfo, \ NL. polymorphus, \ Gr. πολίμορφο, multiform, manifold, \ πολίς, many, + μορφή, form.] 1. Having or exhibiting many forms; characterized by polymorphism; not isomorphous or monomorphous or monomorphous. phous.

I... find it difficult to form any judgment of any author so "many-aided" (to borrow a German expression)—polymorphous as Herder.

De Quinosy, Herder.

2. Specifically, in zoöl.: (a) Undergoing a sories of marked changes during development, as most insects. (b) Varying much in appearance, form, or structure in the same species or group.—3. In bot., same as 2 (b).—4. In music, noting a contrapuntal composition. as a canon or a fugue, in which the themes are or may be treated in various ways, as by augmentation, diminution, inversion, etc.

Also polymorphic.

polymorphy (pol'i-môr-fi), n. [= F. polymorphie; < LGr. πολυμορφία, manifoldness, < Gr. πολύμορφος, manifold: see polymorphous.] Same

matriopod, mannon: see polymorphose.] Same as polymorphism.
polymorntain (pō-li-moun'tān), n. See poly.
Polymyaria (pol'i-mī-ā'ri-ā), n. pl. [NL., \langle Gr. $\pi o \lambda \dot{\nu}_{\tau}$, many, $+ \mu \dot{\nu}_{\tau}$, muscle, + -aria.] One of three principal divisions of the Nematoidea, containing those threadworms in which the muscles of the body-wall are divided into many series, each made up of many muscle-cells.

See Meromyaria, Holomyaria.

polymyarian (pol'i-mi-ā'ri-an), a. and n. I.
a. Of or pertaining to the Folymyaria.
II. n. A polymyarian worm.

Polymyodit (pol'i-mi-ō'dī), n. pl. [NL., < Gr. πολίς, many, + μίς, musele, + φοίη, song.] In Johannes Miller's system of classification (1847), a tribe of birds of an order *Insessores*, including singing birds whose lower larynx is provided with the full number (five pairs) of song-muscles: thus distinguished from the tribes Trachcophone and Picarii of the same author. The term is nearly equivalent to Oscines or Acromyodi of later authors.

polymyodian (pol*i-mi-ō'di-an), a. Same as

polymyoid. polymyoid (pol'i-mi-oid), a. [⟨Gr. πολύς, many, + μύς, musele, + φόή, song. Cf. Polymyodi.] In ornith., having several distinct intrinsic muscles of the syrinx: opposed to oligomyoid. The word is nearly synonymous with acrompodian, but is of less exact signification. The group of birds it denotes is that of the Oscines or singing birds.

polymyositis (pol-i-mi-φ-si'fis), n. [N1_{c.}, < Gr. πολύς, many, + μίς (μέως), muscle, + -itis: see myositis.] Inflammation of a number of muscles.

Polymyxia, n. See Polymixia.
polyneme (pol'i-nēm), n. [< NL. polynemus,
q. v.] A fish of the genus Polynemus.

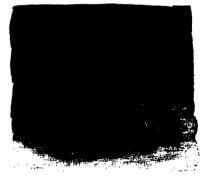

q. v.] A fish of the genus Polynemus.

Polynemids (pol-i-nem'i-de), n. pl. [NI., < Polynemus + -ids.] A family of aenathopterygian fishes, typified by the genus Polynemus. They have a subfusiform shape, with a blunt snout, subsideminal ventrals with a spine and five rays, two dorsals separated by a considerable interval, and with one or two spines, forked caudal, and pectorals with an entire upper part and several free elongated fillform rays below. Sumerous species occur in tropical seas, some of much importance, as the mango tash of India, P. paradiserus.

polynemiform (pol-i-nen'i-form), a. [< NL. Polynemia + L. forma, form.] Having the form of a polyneme; belonging to the Polynemidæ. polynemoid (pol-i-nē'moid), a. and n. I. a. Relonging or relating to the Polynemidæ; polynemiform.

II. n. A polynemiform fish; a polyneme.

Polynemus (pol-i-nē'mus), n. [NL. (Gronovius, 1754), ζ Gr. πολίς, many, + νίμα, throad: see nematoid.] The typical genus of the family Polynemidæ, with the lower pectoral rays sepa-

mon indian species.

Polynesian (pol-i-nė'gian), a. and u. [= F. polynesian = Pg. polynesiano; < NL. Polynesia (see def.), < Gr. πολίς, many, + νήσος, island.]

I. a. 1. [l. c.] Full of islands, as an archipelago.—2. Specifically, of or pertaining to Polynesia. New Caledonia and the New Hebrides, the Fiji, Tonga, and Samoa Islands, and the Society and Marquesas Islands.

II. u. A native or an inhabitant of Polynesia, division of Oceania cust of Australia and Malaysia, or, in the more modern and restricted sense, a division of Oceania east of Micro-nesia and Melanesia.

polyneuritis (pol'i-nū-ri'tis), n. [NL., < Gr. πολίς, many, + νεῦμον, nerve, + -itis. Cf. nen-ritis.] Neuritis affecting a number of nerves; multiple neuritis.

polynia (pō-lin'i-Ḥ), n. [Russ. polututya, an

open place in the midst of ice.] An open or unfrozen place in the midst of the ice of a river or lake or in the ocean: a word used in English only by navigators in arctic seas. By some writers it was formerly used with the meaning of an open or unfrozen (theoretical) sea at the north pole, apparently from the (erroneous) idea that polyuda is connected with pole?.

In such places as Robeson and Kennedy Channels and Bellot's Straits . . . polynics or water-pools are met with on rare occasions throughout the winter. Narre, Voyage to the Polar Sea, I. 234.

Polynos (pō-lin'ō-ê), n. [NL. (Savigny), \langle Gr. $\pi o \delta v_{c}$, much, many, $+ \nu e v_{c}$, swim.] A genus of marine errant annelids of

the family Aphroditidæ: a name used in different a name used in different senses. (a) Applied by Savigny and most authors to such species as the British P. squanuta, an inch or two long, with large ovate and reniform eilisted scales imbricated in a double row of 12 along the whole length of the worm, and the body of equal width at both ends. This worm is Aphrodite squamata of Linneus, also known as Lepidoustus squamatus. (b) After Oersted, 1842, applied to worms resembling (a), but with not less than 70 segments covered forward with small scales in pairs, taked behind, as P. scalependrina of the British Islands.

polynome (pol'i-nōrn), n.

polynome (pol'i-nōm), n. [=F.polynome=Pg.polynomo, n., polynomio, adj., = It. polinomio; < Gr. πολία, muny. + 1.. nomen,
name.] A polynomial.
polynomial (pol-i-nō'mial), a. and n. [< polynome
+ -ial. Cft. binomial.] I.
a. 1. Containing many
names or terms.—2. In

Polyno? squamata, from above, enlarged.

a. prestomial tentacle; b, b', superior and inferior prestomial cirrus; c, c', notopodial and neuropodial cirrus; c', e, elytra; f', space between the posterior lettra; f', s, setar and fumbrise of the elytra. zoöl. and bot., specifically, noting a method of nomenclature in which the

technical names of species are not confined to two terms, the generic and the specific, as they are in the binomial system of nomenclature: as, a polynomial name; a polynomial sys tem of nomenclature: contrasted with binomial and mononomial.

Also multinomial, plurinominal.

Polynomial theorem, the theorem for raising a polynomial to any power.

II. u. 1. A technical name consisting of

more than two terms; a polyonym.—2. An al-gebraical expression consisting of two or more terms united by addition: as,

ax + by + cz - exy - fxz + gyz.

Also multinomial. Appell's polynomial, a form

 $A_{nx} = a_0 x^n + \binom{n}{1} a_1 x^{n-1} + \binom{n}{2} a_2 x^{n-2} + \dots + a_n.$

Homogeneous polynomial, a polynomial in which all the terms are of the same degree in the variables.

polynomialism (pol-i-nō'mi-al-izm), n. [c polynomial + -ism.] Polynomial nomenclature; the method or practice of using polynomials, polynomialist (pol-i-nō'mi-al-ist), n. [c polynomial + -ist.] In zoōi, and bot., one who uses polynomials a polynomial stopp of the polynomials.

polynomials, or a polynomial system of nomenclature, as the pre-Linnean writers usually did. polynuclear (pol-1-nū'klē-hr), α. [ζ Gr. πολίες, many, + NL. nucleus: see nuclear.] Having

many, + 11. maceas: see matear.] Having several nuclei, as a cell.

Polyodon (pō-li'ō-don), n. [NL., < Gr. πολίς, many, + ὐδούς (ἰσδοντ-) = Ε. tooth.] 1. In ichth., a genus of selachostomous fishes, named by Lacépède in 1798, the type of the family Polyodontidæ, having many teeth crowded in bandodontics, having many teeth crowded in bandlike masses during the youth of its members,
these teeth being lost at maturity. P. spatula is
an example. Also called Spatularia. See cuts
under paddit-fish.—2. In conch., a genus of pulmonate gastropods. Desmarest.

polyodont (pol'i-ō-dont), a. and n. [(Gr. πολίς,
many, + bboiç (bbovt-) = E. tooth.] I. a. Having many teeth; multidentate; specifically, of
or pertaining to the Polyodontides.

II. n. In ichth., a member of the Polyodon-

II. n. In ichth., a member of the Polyodontidæ.

Polyodontidæ (pol'i-ō-don'ti-dē), n. pl. [NL., { Polyodon(t-) + -idæ.] A family of selachos-tomous ganoid fishes, typified by the genus Po-lyodon, including the paddle-fishes of the Mis-sissippi basin and related forms of China and sussippi oasin and related forms of China and Japan. The body is naked, or rough with minute stellate ossifications; the snort is much produced; the very wide mouth contains many minute freeth, in youth at least; the nostrils are double; and the dorsal and anal fine are near the heterocercal fin. Also called Spatistarides. **polyommatous** (pol-i-om'a-tus), α . | \langle Gr. $\pi o \lambda v - \delta \mu \mu a \tau \sigma_c$, many-eyed, \langle $\pi o \lambda i \tau_c$, many, + $\delta \mu \mu a$ ($\delta \mu$ -

ματ-), eye, (γόπ, see: see optic.] Many-eyed; having many eyes or eye-like organs.

Polyommatus (pol-i-om'a-tus), π. [NL. (Latrelle), (Gr. πολνόμματος, many-eyed: see polyommatous.]

1. In entom., a genus of butterflies of the family Lycanidae, having many ocelli on the wings (whence the name). There are many species, known as blues, as P. alexis, the common blue, and P. argiolus, the azure blue.—2. A genus of worms. Quatrefages, 1850.

polyonomous (pol-i-on'ō-mus), a. Same as landamamans.

polyonymous.

polyonomy (pol-i-on'o-mi), n. Same as poly-

polyonym (pol'i-ō-nim), n. [< polyonym-ous.]
A name consisting of several (specifically, more than three) terms; a polynomial name in zoology: correlated with mononym, dionym, and tri-ORUM.

polyonymal (pol-i-on'i-mal), a. + -al.] Of or pertaining to a polyonym; poly-nomial.

polyonymic (pol'i-ō-nim'ik), a. [< polyonym-y + -ic.] Consisting of more than two terms, as a name in anatomy or zoölogy; polyonymal; polynomial. Buck's Handbook of Med. Sciences, VIII. 516.

polyonymist (pol-i-on'i-mist), n. [< polyonym + -ist.] Same as polynomialist. polyonymous (pol-i-on'i-mus), a. [< Gr. πολυ-δυυμος, having many names, < πολύς, many, + δυυμα, name.] Having many names or titles; many-titled.

polyonymy (pol-i-on'i-mi), n. [Also polyonomy; = F. polyonymie, ζ Gr. πολυωνυμία, a multitude of names, ζ πολυώνυμος, having many names: see polyonymous.] 1. Variety or multiplicity of names for the same object. Specifically—

2. In zoöl., same as polynomialism.

Polyophthalmus (pol*1-of-thal'mus), n. [NL., ζ (ir. πολίς, many, + ὁφθαλμός, eye.] A genus of remarkable polychætous annelids, having a pair of visual organs on every somite of the balls badded to the balls and the surface of the last to the surface of the same of the surface of the same of the surface of the same of the same

body, besides the usual cephalic eyes.

polyopia, polyopy (pol-i-ō-pi-ji, pol'i-ō-pi), n.

[N1., ζ Qr. πολές, many, + ωψ, face.] The appearance as of two or more objects when there is but one; multiple vision.

polyoptrum, polyoptron (pol-i-op'trum, -tron), n.; pl. polyoptra (-tri). [= F. polyoptre = It. poliottro; < NL. polyoptrum, potyoptron, < Gr. πολίς, many, + ν όπ, see: see optic.] A glass through which objects appear multiplied but

through which objects appear multiplied but diminished. It consists of a lens one side of which is plane, while in the other are ground several spherical concavities, every one of which becomes a plane-concave lens, through which an object appears diminished.

polyopy, n. See polyopia.

polyorama (pol'i-ō-rā'mā), n. [=F. polyorama, < Nl. polyorama, < Gr. πολίς, many, + bpaņa, view, sight, < ὁρῶν, see.] 1. A view of many objects.—2. An optical apparatus presenting many views.

many views. See panorama.
polyorganic (pol'i-or-gan'ik), a. polyorganic (pol'i-or-gan'ik), α. [ζ Gr. πολίς, many, + δργανον, organ: see organic.] Having several diversified or differentiated organs.

In the natural world some beings are monorganic, others are polygrjanic.

Science, IX. 534. ors are polyoryanic.

In the natural world some beings are monorganic, others are polygryanic.

Science, IX. 534.

polyp, polype (pol'ip), n. [= F. polype (also poulpo: see poulp) = Sp. polipo = Pg. polype = It. polipo = D. polyp), policy = G. Sw. Dan. polyp, s. polypus in the nose, lyp, (L. polypus, a polyp, a polypus in the nose, you have a polypus, a polypus in the nose, prop. adj., many-footed, (\piu\tilde{u}\tild

polypantograph (poli-pan'tō-graf), s. [< Gr. možic, many, + E. pantograph.] A form of pantograph by which a number of identical designs may be produced simultaneously from a single pattern

pattern.

polyparia (pol-i-pā'ri-ā), n.; pl. polypariæ (-ā).

[Nl.: see polypary.] The stock of the Anthocon and related polyps; a polypary.

polyparian (pol-i-pā'ri-an), a. [< polypar-y + -tan.] Of or pertaining to a polypary.

polyparium (pol-i-pā'ri-um), n.; pl. polyparia (-ā). [Nl.: see polypary.] Same as polypary.

polyparous (pō-lip'a-rus), a. [< Gr. πολύς, many, + L. parere, produce. Cf. multiparous.]

Same as polytocous, 1.

[All. polypary (pol'i-pā-ri), n.; pl. polyparies (-riz).

[All. polyparium = F. polyper; (L. polypus, a polyp: see polyp and -ary.] The stock of the Anthozoa and related polyps; a polyp-stock, polypidom, or polyparia; the horny or chitinous outer covering or envelop with which many of the Hydrozoa are furnished. The term is also not uncommonly applied to the very similar structures produced by the Polypara; but for these polypary is used by those who desire to keep polypary for the Actinazoa and Hydrozoa. The polypary-producing polypides are propagated by budding, and live together in groups or colonies so associated that each group forms a compound polypary or polypidom, which is their common home, and is at the same time the central atem or stock sustaining the whole. Every individual polyp thus lives in its own proper cavity in the common polypary, from which it protrudes its body and into which it retracts it at pleasure. Also polyparium, polype-colony (pol'ip-kol'o-ni), n. A colony of polype, n. See polyp.

polyps; a compound or aggregate polyp.
polypean (pō-lip'ē-an), n. and n. [< polyp + -e-an.] I. u. Of or pertaining to a polyp or polypus in any sonse.
II. n. A polyp; any polyp-like organism.
Polypedetes (pol'i-pē-dē'tēz), n. [NL., < Gr. πολύς, many, + πεόψτης, one fettered, a prisoner.] The typical genus of the family Polypedetide. containing numerous species, chiefly detidæ, containing numerous species, chiefly

deticlee, containing numerous species, chiefly Oriental. P. maculatus is a common lindian troe-toad. P. eques is called the spurred tree-toad. Polypedatidæ. Pol-i-pet'a-lē), n. pl. [NL. (Tourne-fort, 1694), fem. pl. of *polypetalus: see poly-petalous.] A division or group of dicotyledo-nous plants, characterized by distinct or sepa-mete retals. Comming a circle inside the calvenous plants, characterized by distinct or separate petals, forming a circle inside the calyx, as in the single rose, or several circles, as in the water-lily, magnolia, and cactus. It includes 82 orders, classed in 15 cohorts, and grouped in the 3 sortes Thalantforw, Disciforw, and Calufaforw, with the stamens inserted respectively on the receptacle, disk, or calyx, and having the buttercup, maple, and rose as examples. See disciptedms. Also called Distypetale.

polypetalous (pol-i-pet'a-lus), a. [= F. polypetale = Sp. polipetalo = Pg. polypetalo = It. polipetalo; ⟨NL. polipetalus, ⟨Gr. πολίς, many, + πέταλον, leaf (NL. petal).] In bot., having two or more separate petals: as, a polypetalous corolla. Also apopetalous, dialypetalous, choripetalous. See cut under corolla.

potations. See cut under corolla.

polyphagia (pol-i-fā'ji-\(\frac{1}{2}\), n. [NL.: see polyphagy.] 1. In med., excessive desire of enting; voracity. Dunglison.—2. In zoöl., same as polyphagy.

as polyphagy.

polyphagic (pol-i-faj'ik), a. [< polyphag-y +
-ic.] Exhibiting or characterized by polyphagy; polyphagous.

polyphagous (pō-lif'a-gus), a. [= F. polyphage
= It. polifago (< L. polyphagus, a glutton), <
Gr. moluphagos, eating too much, < molic, much,
+ payriv, eat.] Eating many different kinds of
food; almost pamphagous or omnivorous; not monophagous.

Its [a scale-insect's] polyphagous habit, or the case with which it accommodates itself to so great a variety of plants.

C. V. Riley, U. S. Entom. Bull., No. 15, 1887, p. 12.

polyphagy (pō-lif'a-ji), n. [= F. polyphagie; < NL. polyphagia, < Gr. πολυφαγία, excess in eating, < πολυφάγος, eating too much: see polyphagous.] The habit or practice of subsisting on many different kinds of food; polyphagous

many dimerit kinds of root; polyphagoda regimen. Also polyphagia.

polypharmacy (pol-i-fär´mā-si), n. [= F. polypharmacie, < Gr. πολυφάρμακος, having to do with many drugs, < πολύς, many, + φάρμακον, a drug: see pharmacon, pharmacy.] The prescrib-

ing of too many medicines, especially in one prescription. Dr. J. Brown, Spare Hours. polyphase (pol'i-faz), a. [Gr. mair, many, + E. phasel, n.] In elect., having components of various phase.

polyphemet (pol'i-fēm), n. [< polyphemus.]

polyphonic (pol-i-fon'ik), a. [= F. polyphonique = Pg. polyphonico; as polyphon-ous + -ic.] 1. Capable of being read or pronounced in more than one way: said of a written character.

The particular value to be assigned to each of the poly-phonic characters. Isaac Taylor, The Alphabet, I. 46. 2. Consisting of or having many voices or sounds.

The barking crow possesses the most remarkable polyphonic powers. It can shrick, laugh, yell, shout, whistle, scream, and bark.

Saturday Rev., XXV. 469.

8. In music: (a) Noting a method of composition or a work in which two or more voice-parts

are simultaneously combined without losing their independent character, but with harmo-nious effect; contrapuntal: opposed on one side to monadic, monophonic, and homophonic, and on another to harmonic: as, a fugue is a polyphonic form of composition. (b) Noting an instrument which is capable of producing

plicity of sounds, as in the reverberations of an echo.

I have chosen to single out the passages which relate to the polyphonisms, or repercussions of the rocks and caverns, and other phonocamptic . . . objects below in the mount.

Derhams, Physico-Theology, i. 3.

2. In music, the use of polyphony, or the state

of being polyphonie in structure.

polyphonist (pol'i-fō-nist), n. [< polyphon-y+-ist.] 1. One who professes the art of multi--ict.] 1. One who professes the art of multiplying sounds, or who makes a variety of sounds; polypide (pol'i-pid), n. [\(\chi \) polyp + -idc^2.] An an imitator of a variety of sounds; a ventriloquist.—2. One who understands or uses polyphony: a contrapuntist.

phony; a contrapuntist.

polyphonium (pol-i-fo'ni-um), n. [NL., < Gr.
πολυφωνία, variety of tones: see polyphony.] In
music, a polyphonic composition.

It will be seen how great an element of ambiguity was introduced by the polyphony which arose from the adapta-tion of a Turanian syllabary to a Semitic language. Isaac Taylor, The Alphabet, I. 45.

2. In music, the act, process, art, or result of simultaneously combining two or more voice-parts so that they shall maintain their individuality and independent interest, and yet shall harmonize with each other; counterpoint. It is opposed to mandy, manophony, and hanophony, in which a single voice-part is raised into decided prominence, and to harmony (in one of its senses), in which the attention is centered upon the successive chords as such rather than upon the voice-parts that constitute them. See counterpoints, 3.

Having several sets of teeth, as a fish: opposed to monophyodont and diphyodont.

II. n. A polyphyodont animal.

Polypi (pol'i-pi), n. pl. [NL., pl. of L. polypus, a polyp: see polyp.]

1. The polyps as a class or other high group of low invertebrate animals,

of which the nearest modern synonym is Calentera or Calenterata. Specifically—(at) In Cuvier's system of classification, Polypi were the fourth class of his Radiata, divided line three orders—Carnosi, including Actinia and Lucernaria: Gelatinosi, including Hydra and the Polyzon; and Coralityeri, or the corals at large, with Pennatula, Alejantum, and also the sponges. (b) in Lanckart's system (1868), they were one of two classes of Calentera, distinguished from Acalepha, and divided into two orders, Anthonos and Cylicavos. (c) in Mine-Edward's system (1866), an alternative name of his Corallaria, or the third classof his Radiaria, distinguished from echinoderms and acalepha. Also Polypiaria, Polypifera, Polypiaria (pol'i-pi-ë/ri-ë), n. pl. [NL., < L., polypiaria (pol'i-pi-ë/ri-en), a. and a. [< Polypiarian (pol'i-pi-ë/ri-en), a. and a. [< Polypiaria + -au.] I. a. polyzoarium, just as an individual of a compound coralligenous actinozoan is contained in a cup of the polypidom. The polypide of a polyzoan thus corresponds to the polypite of a colenterate. See polypary, and cuts under Paunatella and Polyzoa.

polypidom (pol'i-pi-dum), n. [⟨ Gr. πολύποις, a polyp, + όψως, house.] An aggregate of polypites or polypidos; a compound polypary, or the dermal system of a colony of individual actinozoans, hydrozoans, or polyzoans; a polyp-stock, or the stem of a colony of zoöphytes, containing the cells of the individual polypites or polypides which fabricate it. Thus, a piece of coral is the polypidom of an actinozoan or hydrozoan; a sea-mat is the polypidom (more exactly, the polyzoary) of a polyzoan. See cuts under Coralligena and Polyzoa.

polypier (pol'i-pēr), n. and a. [⟨ F. polypier, ⟨ Nl. polypiurium: see polypary.] I. n. 1. A polyp in sense (d); a polypite or polypide; one individual, or a single cell, of a compound polyp.—2. A polypidom, polypary, or polypstock; a compound or aggregate polyp; a polyzoarium.

zoarium.

Sometimes each polyp has a distinct polypier, but in general it is the common portion of a mass of aggregated polypi which presents the characters peculiar to those bodies, and thus these form aggregated polypiers, the volume of which may become very considerable, although each of its constituent parts has dimensions which are very small. Polypifera (pol-i-pif'e-rä), n. pl. [NL.: see
polypifer.] Same as Polypi.

polypiferous (pol-i-pif'e-rus), a. [< 1... polypus,
polyp, + ferre = E. bear¹.] Bearing polyps;
producing polypites: as, the polypiferous surface of a coral. Also polypiparous, polypiferom (pol'i-pi-fòrm), a. [< 1... polypus,
polyp, + forma, form.] 1. Having the form,
structure, or character of a polyp; polypomorphic.—2. Having the form or appearance of a
polypus. polypus.

polypigerous (pol-i-pij'e-rus), a. [< L. polypus, polyp, + yercre, carry.] Same as polypiferous.

polypiparous (pol-i-pip'a-rus), a. [< L. polypus, polyp, + parere, produce.] Same as polypiferous. miferous.

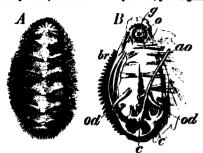

polypite (pol'i-pit), n. [=F. polypite; as polyp + -ite².] 1. The fundamental element in the structure of a polyp, as a hydrozoan or an ac-tinozoan; an individual zooid of a compound polyp; one of the individuals or persons which together fabricate and constitute a polyp-stock together fabricate and constitute a polyp-stock or polypary; a hydrauth. The term is sometimes extended to the corresponding elements of a polypourium or compound polyzon, but these are more strictly called polypides. See cut under Athorybia.

2. A fossil polyp.

polyplacid (pol'i-plas-id), a. [< Gr. πολύς, many, + πλακοίς, a flat cake: see placent.]

Having more than one madreporte plate, as a starfish; not monoplacid. Abbreviated p.

Polyplacophora (pol'i-plā-kof'ō-rā), n. pl. [NL. (J. E. Gray, 1821), neut. pl. of polyplacophorus: see polyplucophorous.] An order of isopleurous gastropods, exhibiting bilateral symmetry and metameric segmentation. The dorsal shell is in eight successive pieces, sometimes embedded in shell-sacs; there are numerous gill-combs and offactory tracts, or ctenidia and osphradia; paired genital

A natural order of ferns, named from the genus A natural order of ferns, named from the genus Polypodium. This order includes the largest number of genera and species, and may be regarded as the typical order of ferns. They are usually herbaccous plants, with a permanent stem, which remains buried or rooted beneath the soil, or creeps over the stems of trees, or forms a scarcely moving point of growth around which new fronds are annually produced in a circle, or it rises into the air in the form of a simple stem bearing a tuft of fronds at its apex, and sometimes attaining the height of 40 feet or more, as in the tree-ferns. The sporangia are collected in dots, lines, or variously shaped clusters on the back or margins of the frond or its divisions, and are provided with an incomplete vertical annulus so that they dehise transversely. It embraces the tribes Polypodicz, Grannatidez, Pieridze, Blechusz, Appleniez, Appletiez, Woodsiez, Dicksoniez, etc. See cuts under Nothoclema and Oncolea.

polypodiaceous (pol-i-pō-di-ā'shius), a. [(Polypodiacee + -ous.] Of or pertaining to the Polypodiacee.

Polypodiese (pol'i-pō-di'ō-ē), n. pl. [NL., < Polypodium + -eæ.] A tribe of ferns of the order Polypodiaces, embracing the genus Polyorder Prosphotaceze, embracing the going Prosphotalism. The sori are on the back of the frond, on the veins, or at the ends of the veins, in roundish clusters, and without industum of any kind.

Polypodium (pol-i-pō'di-um), n. [NL., < L. polypodium, a kind of ferm: see polypody.]

The largest and most widely distributed genus of ferms, typical of the subsection.

cal of the suborder Polypodiaces and tribe Polypodiese. The fronds are very various in outline, with the sori round, naked, dorsal, in one or more rows on each aide of the midrih, or irregularly scattered. About 400 species are known, of which only 9 are found in North America, P. vulgare, which occurs also in the Old World, being the most common. See polypody, polypody (pol'i-podi), n. Polyptychodon (pol-ip-tik'ö-don), π. [Nl. (Owen), ζ Gr. πολυπτυχος, with many folds (see polyptyck), + οδούς (όδοντ-) = Ε. tooth.] A genus of cretaceous plesiosaurians: same as Basilo-

polypus (pol'i-pus), n.; pl. polypi (-pi). [NL., ⟨ L. polypus (pl. polypi), ⟨ Gr. πολυπους (pl. πολυπους, poet. or dial. πολύποι), a polypus: see polyp.] 1. In zoöl.: (a) A poulp or cuttle. (b) A polyp, in any sense. (c) [cap.] (1) A genus of cuttles. (2) A genus of polyps.—2. In pathol., any kind of ture proprietations. any kind of tumor growing from a mucous mem-brane, of rounded form, and more or less dis-tinctly pedunculated. The term is most frequently applied to benign growths.—Polypusforceps, a forceps for grasping and tearing off polypl.
polyrhizal (pol-i-ri'zal), a. [ζ Gr. πολύρριζος,
with many roots: see polyrhizous.] Same as

polyrhizous.

polyrhizous (pol-i-ri'zus), a. [Prop. *polyr-rhizous; = F. polyrrhize: \langle I. polyrrhizos, \langle Gr. πολίφριζος, with many roots, \langle πολίς, many, + $\dot{p}_i \zeta a$, root.] In bot., possessing numerous rootlets independently of those by which the attachment is effected.

polysarcia (pol-i-sür'si-ü), n. [NL., ζ Gr. πολυ-σαρκία, fleshiness, ζ πολίταιρκος, fleshy: see poly-

polyscelia (pol-i-sō'li-ä), n. [NL., ζ Gr. πολύς, namy, + σκέλος, the leg.] In teratol., a monster having many legs.

polyschematist (pol-i-ske'ma-tist), a. [(LGr. polyschematist (pol-i-ské ma-tist), α. [<1.Gr. πολοχημαίτατος, multiform, < Gr. πολός, many + σχηματίζευ, assume form, < σχημα(τ-), form: see scheme.] Characterized by or existing in many forms or fashions; specifically, in anc. pros., admitting as substitutes feet not metrically equivalent, or containing such feet.

polyscope (pol'i-skop), u. [= F. polyscope = Sp. poliscópio = Pg. polyscopio, polyscopio, ζ Gr. πολίς, many, + σκοπευ, view. Cf. Gr. πολίσσος, far-seeing.] 1. In optics, a lens plano on one side and convex on the other, but having the convex side formed of several plane surfaces or facets, so that an object seen through it appears multiplied.—2. In sury., an instrument for illuminating the cavities of the body

ly distributed, and extremely variable genus of red alge. The fronds are filamentous or subcompressed, distinhously or irregularly branching, formed of a monosiphonous axis and several siphons, and either naked or with a cortical layer of irregular cells, furnished with numerous trits of hysline, monosiphonous, dichotomous filaments. The tetraspores are in one, rarely two, rows, in alightly sitored upper branches; cystocarps ovateglobose or urceolate; spores piriform, on short pedicles. See dough-balls, ningerhair, lobster-claus.

polysiphonous (pol-i-si'fō-nus), α. [< Gr. πολύς, many, + σίφων, a tube: see siphon.] In hot.: (a) Having several or many siphons: said of certain algæ. Compare monosiphonous, and see siphon. (b) Resembling, belonging to, or characteristic of the genus Polysiphonia.
polysomatic (pol'i-sō-mat'ik), α. [< Gr. πολυσώματος, with many bodies, < πολύς, many, + σώμα, body,] Consisting of an appreparation of smallers.

body.] Consisting of an aggregation of smaller grains: used by some lithologists to note a

grains: issue by some throughes to hote a grain or chondrus of this character.

polysomitic (pol'i-sō-mit'ik), a. [ζ Gr. πολίες, many, + Ε. somite + -ic.] Consisting of a number of primitively distinct somites which have united or become grouped into a segment or region of the body in any way distinguished from another part of the body: thus, the head, or thorax, or abdomen of an arthropod, such

as an insect or a crustacean, is polysomitic. Hux-

ley, Anat. Invert., p. 220.

polyspast (pol'i-spast), n. [= Sp. polispastos = It. polispasto, < L. polyspaston, < Gr. πολισπαστου, a hoisting-tackle with many pulleys, σποστον, a hoisting-tackie with many rendered, cheut. of πολύσπαστος, drawn by many cords, ($\pi \sigma \lambda^i c$, many, $+ \sigma \pi^{\tilde{a}i}$, draw: see spasm.] 1. A machine consisting of a combination of pulleys, used for raising heavy weights: a term formerly used by writers on mechanics .- 2. An apparatus of the same character formerly used

in surgery to reduce dislocations.

polysperm (pol'i-sporm), ν. [⟨ Gr. πολίσπερμος, with many seeds: see polyspermons.] A tree whose fruit contains many seeds.

All of them easily raised of the kernels and roots, which ay be got out of their pulpsperms.

Evelyn, Nylva, II. iii. § 1. (Latham.)

polyspermal (pol-i-sper'mal), a. [< polysper-

** σπέρμα, seed: see sperm.] Containing many seeds: as, a polyspermous capsule or berry. polyspermy (pol'i-spér-mi), n. [⟨ Gr. πολίς, many, + σπέρμα, seed.] Impregnation of an ovum by more than one spermatozoda. polyspire (pol'i-spir), n. [⟨ Gr. πολίς, many, + σπέρμα, coil.] In zodi., a structure resulting from continued spiral growth through several revolutions. Energe. Brit., XXII. 417.

polysporangium (pol'i-spo-ran'ji-um), n.; pl. judysporangia (-μ). [NL., ζ Gr. πολίς, many, + NL. sporangium.] In bot., a sporangium con-

many, + σκέος, the leg.] In teratol., a monster having many legs.

polyschematic (pol*i-skë-mat'ik), a. Same as in the genus Klossia. Aimé Schneider.

polyschematic, (pol-i-spō'rē-an), a. and n. I. a. Polysporeas; of or pertaining to the Polysporea. II. u. A member of the order Polysporca,

polyspored (pol'i-spörd), a. [< polyspore + -cd².] In bot, containing or producing many spores, as the asci of certain lichens, contain from twenty to one hundred instead of eight, the usual number.

polysporic (pol-i-spor'ik), a. [< polyspor-ons +-ic.] In bot., sume as polysporous.

polysporous (pol-i-spor'rus), a. [= F. polyspore, < Gr. πολύππορος, with many steeds or crops, < πολύς, many, + σπόρος, seed see spore.] Producing many spores. ducing many spores. Specifically—(a) In bot., same as polympored. (b) In mid., polysporeau.

polystachous (po-lis 'iū-kus'), a. [⟨ Gr. πολύς,

many, + στάχυς, an ear of corn, a spike.] In bot., having many spikes.

polystaurium (pol-i-stâ'ri-um), n. [NL.: see polystauron.] Same as stauracin.

polystauron (pol-i-stâ'ron), n. [< Gr. πολύς,

many, + σταυρον, a stake, pale, cross.] Same as slauracin.

polystemonous (pol-i-stem'ō-nus), a. polystemonous (pol-i-stem o-nus), a. [ζ Gr. πολίς, many, + στήμων, warp (stamen).] Having many stamens; having stamens more than double the restaurant

ing many stamens; having stamens more than double the number of sepals and petals: said of flowers. Eneme. Brit., IV. 135.
polystichous (pō-lis'ti-kus), a. [⟨ Gr. πολίς, many, + στίχος, row, line.] In nat. hist., arranged in numerous rows or ranks; multifarious. Compare monostichous and distichous.
Polysticta (pol-i-stik'tā), n. [NL. (T. C. Eyton, 1836), ⟨ Gr. πολίστιστος, much-spotted, ⟨ πολίς, many, + στικτός, verbal adj. of στίζιν, prick, spot.] 1. A genus of ducks related to the eiders, but having the bill not gibbous, without frontal processes, and not feathered to the nostrils, and its tomial edge dilated and leathery. Trills, and its tomini edge dilated and leathery. There is only one species, P. delleri or dipper, known as Steller's eider, a beautiful duck of circumpolar digiribution. The male is chiefly white, black, and chestnut-brown, tinged with sen green on the head. Also called Macropus, Stelleria, and Eniconetta or Hensconetta.

2. In cutom., a genus of coleopterous insects.

Hope, 1840.

polystigm (pol'i-stim), n. [(Gr. πολίς, many, + στίγμα, point, mark.] A figure composed of a number of points.

polystigmous (pol-i-stig'mus), a. [⟨Gr. πολές, many, + στίγμα, mark: see stigma.] In bot., having many carpels, every one bearing a stigma: said of a flower. .

Polystoma (pō-lis'tō-mā), n. [NL., < Gr. πολίστομος, having many mouths, < πολίσς, many, + στόμα, mouth.] Same as Polystomum.
Polystomata (pol-i-stō'ma-tā), n. pl. [NL., neut. pl. of polystomatus: see polystomatous.]
1. The sponges or Porifera, as metazoic organisms contrasted with all other Metazou, or Monadata. stomata: so called from their many mouths or oscula.—2. In Saville Kent's system of classification, one of four sections of *Protozoa*, consisting of the suctorial or tentaculiferous animalcules, or the acinetiform infusorians, having many tentacular organs, each of which serves as a tubular sucking-mouth: contrasted with Kustomata, Discostomata, and Pantostomata. The group is oftener called Tentaculifera.

polystomatous (pol-i-stom'g-tus), a. [< NL. polystomatus (cf. Gir. πολίστομος), < Gr. πολίς, many, + στόμα, mouth.] Having many mouths or apertures for the ingestion of food; specifically, of or pertaining to the Polystomata.

polystome (pol'i-stôm), n. [= F. polystome, < Gr. πολύστομος, having many mouths, < πολύς, many, + στόμα, mouth.] An animal with many mouths. (a) A member of the Polystomata, in either sense, as a sponge or an acinetiform infusorian. (b) A trematoli of the suborder Polystomea; a polystome-fluke.

Polystonea (pol-i-sto no-ii), n. μl. [NL., ζ Gr. πολύστομος, having many mouths: see polystone.] A suborder of Trenatoidea, containing trematoid worms with two small lateral suckers on the head and several posterior suckers, with which a pair of large chitinous hooks are often found. Some species are elongated, and present a kind of segmentation. They are for the most part ectoparasitic. The term is contrasted with *Distances*.

Polystomeæ (pol-i-stō'mç-ō), n. pl. Same as

Polystomese (pol-i-sto'me-o), n. pl. Same as Polystomea.
polystome-fluke (pol'i-stom-flök), n. A fluke or trematoid of the family Polystomide.
polystomids, n. Plural of polystomide.
Polystomidse (pol-i-stom'i-de), n. pl. [NL., < Polystomum + -idæ.] A family of polystomatous Tromatoidea, typified by the genus Polystomum, having several posterior suckers, usually paired and disposed in two lateral rows, and rejutored by an expensive of chitinous books.

inforced by an armature of chitinous hooks. polystomium (pol-i-stō'mi-um), n.; pl. polystomia (-h). [NL.: see polystomo.] One of the numerous fine pores at the ends of the ramifications of the oral arms in some acalephs, re-placing the original mouth, which has become losed by the gradual union of the arms.

Polystomum (pō-lis'tō-mum), n. [NL.: see polystome.] The typical genus of Polystomide, having an oral but no lateral sucker on the anterior end, four eyes, and at the posterior end six suckers, two median hooks, and sixteen small hooks. The species are parasitic, as P. integer-rimum in the bladder of frogs, and P. occilatum in the pharynx of tuttles. A fluke farmerly called P. sampai-nicola, now Hexathyridium venarum, is found in venous blood. Also Polystoma.

polystyle (pol'i-stil), a. [= F. polystyle = It. polistilo, \(\) Gr. πολύστυλος, with many columns, \(\) πολύς, many, + στϋλος, a column: see style².] In arch., having, characterized by, or supported by many columns; surrounded by several rows by many columns; surrounded by several rows of columns, as some Moorish or Arabic courts. polystylons (pol-i-sti'lus), a. [< Gr. πολίστυλος, with many columns, < πολίς, many, + στύλος, column (style). Cf. polystyle.] In bot., bearing many styles. Gray. polysyllabic (pol'i-si-lab'ik), a. [= F. polysyllabique; as polysyllable; consisting of many syllables, specifically of more than three. polysyllabical (pol'i-si-lab'i-kal), a. [< polysyllabic + -ia.] Same as polysyllabic. polysyllabicism (pol'i-si-lab'i-sizm), n. [< polysyllabic + -ism.] Polysyllabic character; the quality of having or of being composed of many (specifically more than three) syllables.

(specifically more than three) syllables.

(specifically more than three) syllables.

polysyllabism (pol-i-sil'a-bizm), n. [< polysyllabiche + -ism.] Same as polysyllabicism.

polysyllable (pol-i-sil'a-bl), n. [= F. polysyllabe = Sp. polisilabo = Pg. polysyllabo = It. polisilabo, a polysyllable, < Gr. πολισύλλαβος, polysyllabic, < Gr. πολίς, many, + συλλαβή, syllable: see syllable.] A word of several syllables; usually, a word of four or more syllables, words of one syllable being called monosyllables, those of two discyllables, and those of three trithose of two dissyllables, and those of three tri-

polysyllogism (pol-1-sil'ō-jizm), n. [ζ Gr. πολίς, many, + συλλογισμός, syllogism: see syllogism.] A combination of syllogisms; a chain of reasoning. - Manifest polysyllogism, See manifest.

is a synonym

polysymmetry (pol-i-sim'et-ri), n. [< Gr. πολύς,

polysyndeton (pol-i-sin'de-ton), n. polysyndeton (pol-1-sin de-ton), n. [NL., = P. polysyndete = Sp. polysyndeton = Pg. polysyndeton, < NL. polysyndeton, < Gr. "πολυσύνδετον, prop. neut. of "πολυσύνδετος, joined in various ways, < πολύς, many, + σύνδετος, bound together: see asyndeton.] In rhet., a figure consisting in the use of a number of conjunctions in close succession; introduction of all the members of a series of coordinate words or clauses with of a series of coordinate words or clauses with conjunctions: opposed to asyndeton. Asyndeton produces an accelerated, polysyndeton a retarded movement in the sontence. Asyndeton gives an effect of accumulation and energy, polysyndeton demands special and deliberate attention to each separate word and clause introduced. Itom. viii. 35, 38, 39 is an example. polysynthesis (pol-i-sin' the-sis), n. [NL., ⟨Gr. πολύς, many, + σίνθεσις, composition: see synthesis.] Composition of many elements; specifically, in philol., composition from an abnormal number and variety of elements.

cifically, in philot., composition from an abnormal number and variety of elements.

polysynthetic (pol'i-sin-thet'ik), a. [= F.
polysynthétique, < Gr. πολυσύνθετος, much-compounded, < πολίς, much, + σύνθετος, compounded of a number and variety of elements beyond the usual norm; exhibiting excessive intricacy of synthetic structure, as by the incorporation of objective and adverbial elements in the verb forms: incapsulated: as a subsembletic word: forms; incapsulated: as, a polysynthetic word; characterized by such compounds: as, a poly-synthetic language: first applied by Du Poncoun to the class of languages spoken by the Indian tribes of America. Also incorporative and (rarely) megasynthetic.—2. In mineral., compounded of a number of thin lamelle in twinning posi-tion to each other, or characterized by this kind of structure: as, a polysynthetic twin. See twin.

Felspar, very fresh and clear, sometimes with distinct polysynthetic twin lines.

Nature, XXX. 12.

polysynthetical (pol'i-sin-thet'i-kal), a. [< polysynthetical (pol'i-sin-thet'i-kal), a. [< polysynthetic + -al.] Same as polysynthetic. polysynthetically (pol'i-sin-thet'i-kal-i), adr. In a polysynthetic manner; by polysynthesis. polysyntheticism (pol'i-sin-thet'i-sizm), n. [< polysynthetic + -ism.] The character of being relevanthetic. polysynthetic.

polysynthetism (pol-i-sin'the-tizm), n. [< polysynthet-ic + -ism.] Polysynthetic structure; polysyntheticism.

If we cannot prove the American languages related except by the characteristic of polysynthetism.

Whitney, Life and Growth of Lang., p. 268.

polytechnic (pol-i-tek'nik), a. and n. [= F. polytechnique = Sp. politécnico = Pg. polytechnico = It. politechnico, < Gr. πολύτεχνος, skilled in many arts, < πολύς, many, + τέχνη, art: see technic.] I. a. Concerning or comprehending many arts: noting specifically educational institutions in which instruction is given in many arts more particularly with reference to their arts, more particularly with reference to their practical application.

II. n. 1. An exhibition of objects belonging

to the industrial arts and manufactures. An educational institution, especially for instruction in technical subjects. A number of such institutions are in successful operation in

polytechnical (pol-i-tek'ni-kal), a. [< polytechnic+-al.] 1. Same as polytechnic.—2. Practising many arts.

The trade guilds of the great polytechnical cities of India are not, however, always exactly coincident with the sectarian or ethnical caste of a particular class of artisans. Sir George C. M. Birdwood, Indian Arta, I. 188.

polytechnics (pol-i-tek'niks), n. [Pl. of polytechnic (see -ics).] The science of the mechan-

polyterpene (pol-i-ter'pen), n. [\(\) poly(meric) + terpene.] In chem., any one of a class of substances polymeric with the terpenes. The class includes, among other substances, cooutchouc, guttaporcha, balata, dammar-resin, and the fossil resins fichtelite, hartite, etc. See polymeric and terpene.

polysyllogistic (pol-i-sil-ō-jis'tik), a. [< polysyllogistic).] Consisting of a chain of syllogisms.

polysymmetrical (pol'i-si-met'ri-kal), a. [As polysymmetrical (pol'i-si-met'ri-kal), a. [As polysymmetry + -ic-al.] Divisible into exactly similar halves by more than one plane, as is the case with all regular flowers. Actinomorphous

polysymmetrically (pol'i-si-met'ri-kal-i), adv. Polythalamia (pol'i-thā-lā'mi-ā), n. pl. [NL., In a polysymmetrical manner; in accordance vision of reticulate amorbiform protozoans, with polysymmetry.
polysymmetry (pol-i-sim'et-ri), n. [⟨Gr. πολύς,
many, + συμετρία, symmetry: see symmetry.]

Susceptibility of division into like halves by less exactly used as a synonym of Foraminifera.
more than one plane; the state of being polysymmetrical.

polysyndeton (pol-i-sin'de-ton), n. [NL., = ular; having many compartments: especially,
polysyndeto = Sp. polisincton = Pg. polysynthin polysyndeto of such character, in distention of reticulate amobilorm protozoans,
whose test is many-chambered or polythalamin: opposed to Monothalamia. The name is
less exactly used as a synonym of Foraminifera.

polythalamian (pol'i-thā-lā'ni-an), a. [⟨Polythalamia+-an.] Many-chambered; multilocpolysyndeton (pol-i-sin'de-ton), n. [NL., = ular; having many compartments: especially,
noting Foraminifera of such character, in disticular the such polythalamian (pol'i-thā-lā'ni-an). tinction from monotkalamian. See cut under

polythalamic (pol-i-thal'a-mik), a. [< Polythalamic + ic.] Having many chamberlets, as a foraminifer; thalamophorous; of or pertaining to the Polythalamia.

polythalamous (pol-i-thal'a-mus), a. [= F. polythalamous (F. πολές, many, + θάλαμος, chamber.] 1. In entom., having several or many chambers: applied to the nests of insects, and to galls, when they contain many cells or com-partments, each destined for or inhabited by a single larva .- 2. In conch., having many com-

single larva.—2. In conch., having many compartments; multilocular polythecial (pol-i-thë'si-al), a. [< polythecium + -al.] Forming a polythecium; pertaining to a compound zoöthecium; compositely zoöthe-

polythecium (pol-i-thē'si-um), n.; pl. polythecia (-a). [NL., ζ Gr. πολίς, many, + δίμα, a box.] A compound or aggregate zoöthecium, consisting of several conjoined lorices, found in various infusorians. W. S. Kent, Infusoria, p. 329. ing of several conjoined loriem, found in various infusorians. W. S. Kent, Infusoria, p. 329.

polyzoa¹† (pol-i-zō'ä), n.; pl. polyzoæ (-ē). [NL.: see polyzoan.] The original name of one of the animals afterward grouped as Polyzoa and Bryozoa; a kind of polyzoan or bryozoan.

On Polyzoa, a new animal, an inhabitant of some acophytes. J. Vaughan Thompson, Zool. Researches (1830). Polyzos² (pol-i-zō'ā), **. pl. [NL., pl. of polyzon, q. v.] 1. A class of molluscoid invertebrated animals; the moss-animalcules, seather than the polyzon of the moss-animals. tebrated animals; the moss-animaleules, soamosses, or sea-mais. They are invariably compound,
forming aggregated or colonial organisms originating by
germination from a single parent polysoon, and inhabit a
polyzoary or polysoarium comparable to the polypary or
polypidom of a compound hydrozoan. (See polypary.)
The individual or person of such a stock is called a polypide, and differs from the polypite of a coelenterate in
aving a complete and distinct slimentary canal suspended freely in a body-cavity or coloma, and in many
other respects. There are definite oral and anal apertures,
not communicating directly with the periviscoral cavity.
The mouth is within an oral disk or lophophore supporting a circlet of ciliated tentacles, the lophophore being
comparable to the wheel-organ of rotifers. The intestine
is bent on itself toward the oral end of the body, bringing
the anus near the mouth, either within or without the
circlet of lophophoral tentacles, whence the terms entoproctous and ecopractous. There is a well-defined nervous
system, the nerve-gauglion being situated in the reënterlag angle of the alimentary canal, between the mouth
and the anus. The respiratory system is represented by
the ciliated tentacles exsertile from the body-sac. There
is no heart. The

A Portion of the Polyzoarium of Plumatella repent, one of the Polyzoarium of Plumatella and are found price protruding from the cells of the ectocyst, increating aubmerged atones, shells, wood, seaweed, and other objects; but some inhabit fresh water. There is great diversity in size, form, and outward aspect. Some resemble corals, or polyps of various kinds, and all were confounded with various celenterates under the name of coralines. Though quite definite as a class, the systematic position of the Polyzoa has been much disputed. Beades having been classed as radiates, zoophytes, and polyps, they have been regarded (a) as worms, and approximated to the Rottlera, being sometimes associated with the rotifers as a class of Vermes; (b) as worms, and approximated to the Rottlera, c) and in a sociated with the brachlopods as a division spart called Malacaescites; (d) as mollusoids, and associated with brachlopods and lamellibranchs in a group called Lipocephala. Their proper position is near or with the brachlopods. The division of the Polyzoa into orders, etc., is not less disputed. Regarded as related to the siphunculoid gephyrean worms, the Polyzoa have been considered to form a third section, called Kupolyzoa, or Polyzoa proper, of such organisms (the other two being Pterobranchia and Verniformia), and then divided into two ambelasses. Ectoprocta, with anus external to the tentacles—the former consisting of two orders, Phylactolsemata and Gymnolsemata. Again, the Polyzoa proper have been directly divided into (a) Gymnolsemata, onnisting of two orders, and Endoprocta, with anus external to the tentacles—the former consisting of two orders, Phylactolsemata and Gymnolsemata. Again, the Polyzoa proper have been directly divided into (a) Gymnolsemata, onnisting of the Chilostomata, and genera are numerous, and date back to the Silurian. A member of the class was named a polyzoa by J. Vaughan Thompson in 1830; in 1831 Ehrenberg named the class Bryosca, and the two names hav

natus, with many seeds (granatum, > F. granado pomeridian (pō-me-rid'i-an), a. [= Pg. pome= Sp. granada, pomegranate), < granum, seed, ridianus, < L. pomeridianus, postmeridian: see grain: see grain!, granade, garnet!.] 1. The fruit postmeridian.] 1. Postmeridian. of the tree Punica Granatum. It is of the size of an orange, has six rounded angles, and bears at the summit the remains of the calyx-lobes. It has a hard rind filled

anate (*Punica Granatum*) with Fl a, the fruit; b, the fruit, transverse section; c, flower, longitudi section, the petals removed.

with numerous seeds, each inclosed in a layer of pulp of reddish color and pleasant subsold taste (the edible part of the fruit). It affords a cooling drink, and in Persia a wine is derived from it, as in Mexico an ardent spirit. The rind contains a large amount of taunin, and has been employed in tanning and as an astringent medicine. The pomegranate is outwardly of a beautiful orange color shaded with red.

There were, and that wot I ful wel, Of pome-paraettys a ful gret del. Rom. of the Ross, l. 1856.

Num. xiii, 28.

2. The tree, Punica Granatum, which produces the fruit poinegranate. A native of western Asia to northwestern India, it is now widely cultivated and naturalized in subtropical rugions. It is a deciduous tree, if or 20 feet high, with numerous alender branches, some of them armed with thorns, the leaves lance-shaped or oblong. It is a fine ornamental plant, the flowers scarlet, large, and sometimes doubled. The latter are used in medicine like the fruit-rind, under the name of balustime, and they also afford a red dye. The bark supplies the color of yellow morocco leather, and that of the root is an efficient teniacide, this property residing in an alkaloid, pelletterine, contained in it. It also yields punicotamic acid and mannit. The pomegranate has been known as a fruit-tree from the earliest times; it was common in Italy in the third century n. c., was familiar to the Hebrews, and its fruit-was copied on Egyptian and Assyrian monuments and later on the pillars of Solomon's temple. It thrives in the southern United States, and can be grown with moderate protection even in the climate of New York.

Parchy. The title pope (Latin papa or papas, Greek racky.) pope: see μαρια.] 1. The Bishop of Rome as head of the Roman Catholic Church and hierarchy. The title pope (Latin pape or papea, Greek πάπας, πάππας), literally 'papa' or 'father,' was given in the early church, both in the East and West, to bishops in general, and has from the middle of the third century to the present day been an especial title of the patriarch of Alexandria. In the Western Church it began to be restricted to the Bishop of Rome in the sixth century, and in 1073 the assumption of the title by any other bishop was formally forbidden. In the Eastern Church its same word (with a different accentuation, παπάς) became a familiar title of ordinary priests, and is commonly so used at the present day. According to Roman Catholic teaching, the Pope is not only bishop, metropolitan, and patriarch, but, as incumbent of the Roman see, is successor of St. Peter, and as such vicar of Christ and visible head of the whole church, and supreme pastor and teacher of all Christians. From his decision there is no appeal; and when he speaks ex cathedra—that is, in discharge of his office and by virtue of his supreme apostolic authority—his teaching regarding faith and morals is to be accepted as infailible. (See afailibiting. 1). Even in very early times the Bishop of Rome addressed other churches in a tone of authority. The first great asserter of the privileges of the Roman see was Leo I. (440-461); and the medieval papey reached its climax of spiritual and temporal power under Gregory VII. (1073-86).

— Syn. Populace, Mob. Rabble, crowd, masses. Populace is used to represent the lower classes, the body of those without wealth, education, or recognised position; it is, however, much less opprobrious than mob or rabble. Mob is a very strong word for a tunultuous or even rictous assembly, moved to or toward lawlessness by discontent or some similar exciting cause. Rabble is a contemptuous word for the very lowest classes, considered as confused or without sufficient strength or unity of feeling to make them especially dangerous.

Populus (pop'ū-lus), n. [NL. (Tournefort, 1700), I. populus, popular: see popule², popular.] A
genus of dicotyledonous trees of the order Salicines, including the poplar and aspen, having diocious flowers in catkins without floral envelops, and distinguished from Salix, the willow by the numerous ovules, obliquely lengthened and cup-shaped disks, broad and toothed bracts, loosely flowered and generally pendulous eatkins, and broad leaves. The 18 species are all natives of the northern hemisphere. They are trees with angled or sometimes cylindrical branches, scaly resinous bads coated externally with varnish before opening, and catkins appearing before the leaves, which are alternate and slender-petioled, feather-wined and three-nerved, sometimes entire and triangular, often toothed or lobed. Most species presents very characteristic appearance when in flower, from the long drooping catkins and their red anthers and white-fringed scales. The fertile catkins discharge innumerable seeds, each enveloped in white cottony down, which fill the air about the trees in May, and collect in small drifts like snow; hence the name cottomroud, which is in use for several American species. P. Trenuta of Europe and P. trenshides of America, the aspens, are remarkable for the tremulous motion of their leaves, due to the vertical flattening of their leafstalks (see cut under loosely flowered and generally pendulous catpetiole). See quaking asp (under asp1), aspen, aud wires' tongues (under audi), and corticine. For other species, see poplar, the general name of the genus.

porcelain (pôrs'lặn or pōrs'lặn), n. and a. porcelain! (pôrs'lān or pōrs'lān), n. and a. [Formerly also porcellan, porcelane, also irreg. purslaine, purslane, purslane (by confusion with purslane!, which was also written porcelain); = D. porcela = G. porcelan, porcelaine = Dan. porcellan = Sw. porslin, (OF. porcelaine, pourcelaine, porcelaine, porcelaine, porcelaine, chinaware, also the purple-fish, the Venusshell, F. porcelaine, porcelain, china, cowry, sea-snail, = Sp. porcelaina = Pg. porcelaina, porcelain (so called because its finely polished surface was compared with that of the Venus-shell), also the purple-fish, the Venus-shell, so called also the purple-fish, the Venus-shell, so called because the curved shape of the upper surface resembles the curve of a pig's back, < porcella, a little pig, a pig, dim. of porce, m., porca, f., a hog, pig: see pork.] I. n. A ceramic ware having a translucent body, and when glazed (see hog, pig: see pork.] I. n. A ceramic ware having a translucent body, and when glazed (see biscuit, 3) a translucent glaze also. It is of various kinds: (a) Hard-paste (or natural) porcelain, of which the principal material is a peculiar clay commonly known as kackin, with which is combined some silicious material (in Chiua, petuntse; at Evres and elsowhere in Europe, white sand, and sometimes chalk, or roasted and ground flints). The glase is of similar composition, the silicious ingredient being sometimes rock-crystal ground to powder. (b) Soft-paste (or artificial) porcelain, of which the composition varies; it was originally an attempted imitation of the hard porcelain brought from China and Japan. Sand, niter, soda (or other alkaline substance), gypsum, salt, and other ingredients enter into it, and, in order to make it plastic, glue or some similar material is added. The glaze is hard, and the ware is not exposed to the greatheat of the hard-porcelain furnace. (c) Hybrid or mixed porcelain, which is also a compound produced in attempted imitation of Oriental porcelain, but contains a certain amount of a knollinic clay. Of these three varieties, Chinese and Japanese porcelain, the porcelain of Dresden, Vienua, and Sèvres (since about 1770), and in England that of Bristol, Plymouth, and Lowestoft are of the first: St. Cloud, Sèvres (before 1770), and most English wares are of the second; and the medleval Italian wares, with some English ones and perhaps some modern ones of the European continent, belong to the third; but the distinction between the second and third is often hard to fix or ascertain.—Alcora porcelain, a rich porcelain having a metallic luster not unlike that of majolica, made at Alcora in Spain, toward the end of the eighteenth century. The mark is an Ain gold-colored luster.—Amstel in full, or with an A, and is of great excellence of manufacture, rarely in decorated in a simple way, especially with small psintings of birda.—Arita porcelain, commonly known as Old Japan, Hisen

porcelain, and Imari porcelain, the greater part of which was made at the town of Arita. See Hisen porcelain.—
Berlin porcelain, porcelain made at Berlin, Prussia, especially a hard-paste porcelain made at the royal factory (founded by a private person in 1750, and bought by frederick the Great thirteen years later). This ware has been made down to the present day. The mark has usually been a scepter in blue under the glaze, to which has been added K. P. M., for Königl, Porsellan Manufaktur; but the recent productions are marked with a circular seat having the above German words in full around the rim and the royal eagle in the middle. The uses to which this ware is put are extremely varied, and decoration of every sort has been tried in it, and generally with success. Lithophane belongs to it, as well as a curious manufacture called purcelain-dae, which is added to decorative figures, and is produced by soaking lace or a similar fabric in the porcelain-slip, and then firing, by which the threads are destroyed and the pattern left in thin filaments of porcelain. Bone porcelain. See bone!—Bow porcelain, a soft-puste porcelain made at Stratford-le-Bow, near London, generally decorated by figures in relief and in painting of the simplest character. It is the earliest English porcelain. A frequent decoration is what is called the hawthorn pattern (thorny branches covered with blossoms, frequently in slight relief). A frequent mark of Row china is a bent bow with an arrow on the string.—Brandenburg porcelain, porcelain made at a factory near frandenburg porcelain, porcelain made at Bristol in England, especially a ware made in the eighteenth century from the Cornwell by porcelain.—Brand in porceasing precision in the eighteenth century from the Cornwall china-stone, and directed by a potter named thamplon, who bought out Cookworthy's interest. But since shout 1830 all pieces are marked before decorating with the letter S, and a date in green included in a cartouche, and, when the piece is sold undecorated, this mark is cut through by a touch to a grinding-wheel. — Solom porcelain, porcelain made either at Paris or at the national factory at Sevres, and decorated in low relief by layers or coats of knolinic slip applied one upon another, producing a bas-relief more or less translucent, according as the application is less or more thick. — Swanses, porcelain porcelain made at Swanses from about 1814 till 1820, when the factory was removed to Coalport. But little porcelain was made, as the factory was devoted chiefy to delf and what was called opaque china; but the quality of it was excellent, and it is ranked by some as the most perfect porcelain ever produced in England. The word Swanses, sometimes combined with a trident or with two tridents crossed, and sometimes with the name of the director for the time being, is used as a mark. — Tender porcelain, a ceramic ware in which the composition of hard-paste or natural porcelain is imitated. The clay of which it is made is an imperfect kaolin — that is to say, it contains too much of other substances in combination with the feld-spar to furnish a natural porcelain. — Worcester Porcelain, a soft-paste porcelain nade at Worcester Porcelain (25), by an association called the Worcester Porcelain, a soft-paste porcelain, and at a very early time, and the association also produced a line and white ware imitated from the Chinese, and male up in decorative pieces. A peculiar mottled quality of the blue, produced by the running of the color in firing, was especially admired. The manufacture is still continued by a joint-stock company. the common poreigne of southern Europe and northern Africa. Such quills may be a foot long; they are prettilly variegated in color, and much used for penhelders. Brush-tailed porcupines constitute the genus Atherican, and inhabit the Malay region and Africa. The only North American porcupines belong to the genus Brethton, of which there are 2 species, the common castern R. dorsafus, and the western yellow haired R. epizzanthus; in both the spines are only an inch or two long, and mostly hidden in long hair. They are of large size, reaching 2½ feet in length, and of ungainly form and ugly visage, with an extremely stout and clumsy body and broad, flat, blunt tail. One or the other species is found from the northern limit of trees through the greater part of the United States.

The spines grow mostly on the rump and back of the broad flat tall; they are quite loosely attached, and when the animal slaps with its tall (its usual mode of defense) some quillis may be firted to a distance. Nomething like this, no doubt, gives rise to the popular notion that the porcu-

pine "shoots" its quills at an enemy. These small quills are strikingly like the spines of the prickly-pear (Opandia) in size and shape, and like them are minutely barbed at the end, so that they stick in the flesh of one who receives a blow from the tail. They are much used by the Indians for trimming buckskin garments and ornamenting moccasins. Other American true-percupines constitute the genera Sphingerus and Chetronys; they are of smaller size and arborusi habits, and range from southern Mexico through a great part of South America. See Hystricides, Hystrix; also cut under prehensile-tailed.

mathematical proposition among the Greeke,
corporating the regions of which there continues mathematical proposition among the Greeks, concerning the nature of which there continues to be much dispute. The corollaries to Euclid's elements—that is, extra propositions, inserted by comments—tors and readily deducible from his theorems—are called by this name. But the word had a more general meaning, which Chanles defines as follows: A porism is an incomplete theorem expressing a relation between things variable excerding to a common law, the statement being left incomplete in regard to some magnitude which would be stated in the theorem properly so called. For example, to say that there is within every triangle a point every line through which has for the sum of its distances from the two vertices which lie on one side of its distance from the thrivertus, is a porism in substance. But the porism was further distinguished by a peculiar mode of enunciation, namely, that which in modern language is made to be constant, is called in the porism "given." The definition of Tlayfair, which has had great currency, is as follows: A porism is a proposition affirming the possibility of finding such conditions as will render a certain problem indeterminate, or capable of innumerable solutions. This is the sense in which the word would ordinarily be understood-day. Other widely different definitions have been given.

The English form of the latin word perphyrites, used by the Romans to designate a ce sain rock having a dark-crimson ground through which are scattered small crystals of feldspar. In Pliny's time tered small crystals of feldspar. In Pliny's time

this rock, which was quarried in Egypt, was used extensively for architectural and ornamental purposes, and especially for the base or lower part of busts of which the upper part was made of bronze or marble. Later on, a similar stone appears to have been procured from nearer localities, as from the island of Yardinia. To the Italians it became known as perfetorese antico. Other rocks having a similar structure, commonly called perphyritic, were used in Italy, and designated, in accordance with the predominating color, as perfeto zero, perfeto service, etc. In modern times the term perphyry has come to be used as the name of any rock consisting of a very fine grained or microcrystalline ground-mass through which are disseminated distinctly recognizable crystals of some mineral; but the popular use of the word is frequently extended so as to include rocks which are dark-colored, fine-grained, and very hard, and which do not appear to belong either to the marbles or graintes, and this is done even when the perphyritic structure is not at all or only very indistinct y maiked. The varieties of porphyry are numerous, and their nomenclature by no means definitely established. The most generally accepted are the following: quartary perphyry, of which the ground-mass consists of an initimate or cryptocrystalline admixture of orthoclase and quarts, in which distinct crystals or large grains of quarts are developed; feldspar, felatic or felatione purphyry, having a similar base with porphyritically inclosed crystals of feldspar, which is commonly orthoclase; but similar crystals of this mineral are not infrequently found occurring with the quarts in quarts perphyry, so that no very distinct line can be drawn separating the two varieties mentioned. These porphyries are of most frequent occurrence in the Palessole rocks, but they are also found in abundance in other Pre-tertiary formations, presenting the characters of a truly cruptive material. See purphyrite, and cut under porphyritic.

Naut., to turn or shift to the left or larboard side of a ship: as, to port the helm (that is, to shift the tiller over to the port or left side).

The William had her sterne post broken, that the rud-der did hang clean bouldes the sterne, so that she could in no wise port her helm. Haktuyt's Voyages, 1, 448,

II. intrans. Naut., to turn or shift to the left or larboard, as a ship.

or intboard, as a snip.
port4 (port), n. [See port4, v.] Nant., the larboard or left side of a ship (when one is looking forward): as, "the ship hoels to port"; "hard a port." The left side of the ship is now called port in preference to the old troboard, to prevent confusion with starboard in orders, from resemblance of sound.

U. S. Navy Department, Washington, Feb. 18, 1846.
It having been repeatedly represented to the Department that confusion arises from the use of the words "larboard" and "starboard" in consequence of their dullarity of sound, the word "part" is hereafter to be substituted for "larboard." George Bancroft, Sec. of the Navy.

The whatemen are the only class of seemen who have not adopted the term part instead of larboard, except in working ship. The larboard boat was this boat to their great-grandfathers, and it is so with the present generation. More especially is this the case in the Atlantic and South Pacific floots; but recently the term part-hoat has come into use in the Arctic fleet. Fisheries of U. S., V. ii. 248.

wine of Fortugal, manieu from Oporto (see above). The name is usually given to a very dark-red or purplish wine, but it is sometimes pale. The wine usually sold under the name of part is partly artificial, prepared or "doctored" by blending, etc. Wine of also-lutely pure growth is seldem to be got under the name. This wine is a favorite for imitation by blending and aweetening, etc., in American wines, both east and west, which are sold as American port.

In England port is adulterated with the red Spanish wine of Tarragons, which is a true wine, but procurable at half the cost of the cheapest port. Energe. Brit., X VII. 766.

In fact, when people spoke of wine in these days, they generally meant port. They bought port by the hogshead, had it bottled, and laid down. They talked about their cellars solemnly; they brought forth bottles which had been laid down in the days when George the Third was king; they were great on body, bouquet, and boeswing; they told stories about wonderful port which they had been privileged to drink; they looked forward to a dinner chiefly on account of the port which followed it; real enjoyment only began when the cloth was removed, the ladies were gone, and the solemn passage of the decanter had commenced.

W. Beaunt, Fifty Years Ago, p. 165.

Portulaca (por-tu-la-k-ki, often-lak-ki), n. [NL. (Tournefort, 1700), \lambda. portulaca, also porcilaca, purslane: see purslane!.] 1. A genus of polypetalous plants, type of the order Portulace. It is characterized by a one-celled ovary, with many ovules, halt-coherent with the ealyx, and surrounded at its middle by the two enlyx-lokes, four to sky petals, and eight or many stannens—all others in the order having the ovary free. There are about 20 species, natives of the tropics, especially in America, and one, P. okeracea, the purslane, a weed widely scattered throughout temperate regions. All are fleshy herbs, prostrate or ascending, with thick jutey and often cylindrical leaves, mainly alternate, and bearing terminal flowers, yellow red, or purple, often very bright and showy. Many species are in cultivation, under the name portulaca, P. grandtifore bearing also the name of san-plant, the flowers expanding in bright sunshine.

J. von Jacquin, 1786), \(Portulaca + -aria. \) A genus of plants of the order Portulacese, having two short sepals, four or five longer petals, and from four to seven stamens, unlike any other member of its family in its single ovule, and also member of its family in its single ovuile, and also in its winged fruit. The only species, P. Afra, is a smooth South African shrub, with itselfy and obovate opposite leaves, and small rose-colored flowers clustered in the upper axils, or forming a leafy panicle, followed by three-winged capsules which do not split open when ripe. It is the spek-boom of the Cupe colonists, and afforts in many places the principal food of the dephant besides giving by its pale-green foliage a characteristic aspect to the country. Also called parsiane-tree.

In arith., the act of assuming an approximate value for an unknown quantity, and thence determining that quantity by means of the data termining that quantity by means of the data of a given question. A value of the unknown quantity is posited or assumed, and then, by means of the given connection between the unknown and a known quantity, from the assumed value of the unknown a value of the known is calculated. A new value of the unknown is then assumed, so as to make the error less. In the rule of simple position, only one assumption is made at the outset, and this is corrected by the rule of three. In the far superior rule of double position, two values are assumed, and the corrected value of the unknown is ascertained by the solution of a linear equation. Also called the rule of supposition, rule of false, and rule of trial and error.

8. In logic, the laying down of a proposition, generally an arbitrary supposition; also, the propo-

2. In law, the physical control which belongs of right to unqualified ownership; the having a thing in such manner as to exclude the coua thing in such manner as we wanted the control of other persons; that detention of or dominion over a thing by one person which precludes others from the adverse physical occuminion over a thing by one person which precludes others from the adverse physical occupancy of or dominion over it. In modern law the
legal conception of possession is intermediate between the
conception of right and that of physical occupancy, and
shares something of the qualities of both; but there is great
difference of view as to the precise signification and the
resulting proprieties of use. In general, all are agreed that
a master has possession of a thing which belongs to him
but is in the hand of his servant, however far away; but a
lender has not possession of a chattel in the hand of the
borrower. In respect to real estate, the landlord was formerly said to have possession, and the tenant was not said
to possess or Asse possession, but only to be in possession.
The distinction is now more commonly expressed by saying that the tenant has actual possession (padis possession,
although the legal possession is legal in the sense of being lawful, but is not the legal possession in the sense in
which that term is used in contrast to mere physical occupancy without any right of ownership. Possession is sometimes said to involve the intent to exclude others, but a
man may have possession without such intent, as where
a tain and the sense of possessing, as where
a thing severy and it has not been removed
or even without the consciousness of possessing, as where
a taing is forgotten or supposed to be lost. In Roman
law, possession required not only physical control, but
also the animus domini. When these two elements concurred, there existed a right which was protected against
everybody, including the rightful owner. If he disturbed

the possession, he could not in defense to the action (interdict) brought by the possessor plead title, but he had to resort to a separate action in order to easert his right. It was not necessary in order to make this protection that the possession should be in good faith, but good faith was necessary in order to make possession ripen into title by prescription. In some modern systems of law, for example the French code, possession acquired in good faith gives an ownership of chattels.

See action.—Delivery of juridical possession. See demonsion. He will possession, the authority granted by a court to the presumptive heirs of an absentee, who has not been heard of for a certain period of years, to take possession of his proposession, the suthority granted by a court to the presumptive heirs of an absentee, who has not been heard of for a certain period of years, to take possession of his proposession, the suthority granted by a court to the presumptive heirs of an absentee, who has not been heard of present enjoyment; referring not to the fact of the thing owned being in the owner's possession, which may or may not be the case but to the fact of the thing owned being in the owner's possession, which may or may created as to vest in the owner thereof a present right of present enjoyment: referring not to the fact of the thing owned being in the owner's possession, which may or may not be the case, but to the fact that the right of present possession is an estate or title in the owner, as distinguished from an expectant estate.—In possession, add of a person in actual possession of a thing, or a thing in the actual possession of a person gives all his possessions or everything which he may possess at death, he gives not only the things of which he may be in possession, but also his property of which the may be in possession. When used of an estate, it designates such an estate or interest as gives a right of possession, as distinguished from an expectant estate. Thus, a gift to one person to take effect after the death of another is said to vest in possession. Another is said to vest in possession, when the death occurs irrespective of actual taking possession, and destery.—Raked possession, mere possession without color of right.—Natural possession. 2. A thing possible; that which may take place or come into being.

Consider him antecedently to his creation, while yet he lay in the barron womb of nothing, and only in the number of passibilities, and consequently could have nothing to recommend him to Christ's affection. South.

Never country had such a fortune, as men call fortune, as this, in its geography, its history, and in its majestic possibilities.

Engrson, Fortune of the Republic.

3. Specifically, in law, a chance or expectation; an uncertain thing which may or may not happen. It is near or ordinary, as where an estate is limited to one after the death of another; or remote or extraordinary, as where it is limited to a man provided he shall be married to a certain woman, and then that she shall be married to a certain woman, and then that she shall be married to a certain woman, and then that she shall die, and he be married to another. Whatton. Logical possibility. See byieal.—Permanent possibility. See permanent.—Physical possibility of issue extinct, a term, formerly of some importance it the law of real property, used to designate the effect of the age of a woman under a gift conditioned on having issue. The highest authorities in medical jurisprudence sustain the proposition that a woman beyond the age of fifty-five has, in the leval sense, no possibility of issue. Extinction of possibility may be inferred at an earlier age, varying with the evidence as to the length of married life and the condition of health. Practical possibility, capability of being realized by an uncertain thing which may or may not hapmeans within the power of the persons considered.—Real possibility, indeterminateness in things as to the future happening or non-happening of something which lies within the power of a free agent.

possible (pos'i-bl), a. [< ME. possible = Sp. possible bylle, < OF. (and F.) possible = Sp. known not to be true in some hypothetical state of information. The only kind of object which in strict propriety of language can be called possible is the truth of a proposition; and when a kind of thing is said to be possible, this is to be regarded as an elliptical expression, meaning that it is of such a general description that we do not know it does not exist. So an event or act is said to be possible, meaning that one would not know that it would not come to pass. But it is incorrect to use possible meaning practicable; possible is what may be, not what can be. A proposition is topically possible, if it would not be known not to be true by a person who should know nothing but the principles of logic and the meanings of words; physically possible, if it would not be known not to be true by one who should know all the laws of nature, but none of the particular facts; practically possible, if it were not known not to be about to be accomplished to one who should know what was in the power of the persons cancerned, but not their dispositions, etc. known not to be true in some hypothetical state

Since the frontal bone usually circumsoribes more than half of this orbit, a postorbital process is usually also a postfrontal process. This process, when formed of the frontal bone, varies much in size and shape, and may be present or absent in the skulls of animals closely related, therefore furnishing a useful soliogical character. Compare, for example, the large hooked postorbital process of the skull of the hare, figured under Leporidz, with the absence of such a formation in the skull of another rodent, the beaver, figured under Castor. In man the corresponding formation is known as the external angular process of the frontal bone. (b) Bounding the orbit behind, as a separate bone of sundry reptiles. See the noun. (c) Lying backward (caudad) of the orbit of the eye, on the surface of the body; postocular: as, the postorbital part of the head. Encyc. Brit., XII. 636.—2. Amer. Jour. Philol., VI. 347.

2. In gram., a word or particle placed after or at the end of a word: opposed to preposition. [Rare.]

In almost all the native languages of Asia, what we call prepositions follow their noun; often, like the article and reflective pronoun, coalescing with it, so as to form, or simulate, an inflection. The inconvenience of such a term as preposition is now manifest; nor is it much remedied when we allow ourselves to use the contradictory phrase postpositive preposition. What is really wanted is a general name for that part of speech under which preposition and postposition may stand as co-ordinate terms.

Latham, Dict., II. 568.

most recent division of the geological series, including all that is later than that which can properly be denominated Tertiary: frequently called Quaternary. The line of division between the Tertiary and the Quaternary is, in many regions, one which cannot be sharply drawn, and geologists differ essentially in regard to the nonenclature of the groups more or less vaguely designated by the terms Posteriary, Pleistocene, Quaternary, recent, and diluvial, as well as to the meaning and limitation of the term glacial, all these being subdivisions in use as designating more or less of the deposits later than the Tertiary. In general it is stated in the text-hooks that none of the Post-tertiary species are extinct; but this applies only to the mollusks: deposits containing extinct forms of the higher animals, and probably also of plants, are by many geologists unhesitatingly called Post-tertiary. In the region where geology has been longest cultivated (northwestern Europe) ice has played an important part in Post-tertiary times; hence, a classification of deposits of this age is largely infinenced by this circumstance, and a parallelism of the more recent deposits of glacinted and non-glaciated regions — the latter comprising much the larger part of the earth's surface — is greatly increased in difficulty. See Quaternary and Pleistocene.

2. A proposition proposed for acceptance without proof; something taken for granted; an assumption. Thus, the postulates of Euclid were as follows: (1) that a straight line may be drawn between any two points; (2) that any terminated straight line may be produced indefinitely; (3) that about any point as a center a circle with any radius may be described; (4) that all right angles are equal; (5) that if two straight lines lying in a plane are met by another line, making the sum of the internal angles on one side less than two right angles, then those straight lines will meet, if sufficiently produced, on the side on which the sum of the angles is less than two right angles. See axiom.

The a postulate to me that Methusalem was the longest lived of all the children of Adam. Sir T. Browne, Religio Medici, i. 22.

When you assume a premise without demonstrating it, though it be really demonstrable, this, if the learner is favorable and willing to grant it, is an assumption or hypothesis valid relatively to him alone, but not valid absolutely. If he is reluctant or adverse, it is a postulate, which you claim whether he is satisfied or not.

Grote, Aristotle, vii.

3. A self-evident practical proposition, to the effect that something is possible: opposed to an axiom, as a self-evident proposition that something is impossible. The fourth and fifth of Euclid's postulates (soe def. 2) being converted into axioms in the modern editions, and his proved propositions being distinguished into theorems and problems, this new conception of a postulate naturally arose.

to leave them. Bp. Atterbury, Sermons, I. xl. = Syn. 2. Position, Posture, Attitude, Pose. These words agree in expressing the manner of standing, sitting, lying, etc. The first three may be used in a figurative sense; as, my position on that question is this; his attitude was one of hostility to the measure. Position is the most general word, and is applicable to persons or things. Position is generally indured, and may be awkward. Attitude is generally studied for the sake of looking graceful; hence it is sometimes affected, the practice of it being then called attitude in a fine purpose of initiation or exemplification; generally attitude in more artistic than positive. Positive is generally used of the whole body; attitude has more liberty in referring to the parts of the body, specially the head; but position is more common in such cases. Pose is now confined to artistic positions, taken generally for effect, of part or the whole of a body or representation of a body, as a statue or a picture.

The absolute position of the parties has been altered; the relative position remains unchanged.

Potash-salts play a most important part in vegetable life, existing in all plants in various proportions, and in various combinations with both inorganic and organic acids. When plants are burned, the inorganic constituents remain behind in the sales, and it is by the lixivation or leaching of those sales. burned, the inorganic consiltations remain bedded in the sakes, and it is by the lixiviation or leaching of those askes that potash was first obtained, a process with which the dreeks and Romans were acquainted, although they were unable clearly to distinguish potash from sods, calling them both by the same name (**roo**, nitrum). The name potash is of comparatively modern origin, and is derived from the fact that the potassiferous solution from woodashes was boiled down or concentrated in pots. It was not until about the middle of the eighteenth century that the two alkalis, sods and potash, were clearly distinguished from each other; but they were considered to be simple substances until after the beginning of the nineteenth century, when their metallic bases were separated from them by Davy (1807–88. Up to comparatively recent times the potash compounds used in the arts—and they are memoras and of great importance—were chiefly obtained in the form of crude potash after the method indicated as laving given origin to the name of this alkali, and this method is still in use, although mutch less important than it formerly was. Saltpeter, or the nitrate of potash, had been long known, and obtained in a very different way. (See autywies). Since the beginning of the present century potash has been obtained in considerable quantity from the refuse of beet-root used in the manufacture of sugar, and from sheep's wool. It has also been got (in the form of supply is the region near Stassfurt in Prussia, where two minerals containing potassic compounds cernalille, a double chierid of potassium and containing and manufactum, and cenite, on conormation seal-water; but the most important source of supply is the region near Stassfurt in Prussia, where two minerals containing potassic compounds (carnallite, a double chorid of potassium and magnesium, and caenite, containing sulphates of potash and magnesium with chlorid of magnesium) are found in abundance, and mined on a large scale. From these naturally occurring potassiferous compounds all the various saits of potash used in the arts are manufactured, and it is by using the potash-saits obtained at Stassfurt that the Chili satipeter (nitrate of sods) is converted into common saltpeter or niter (nitrate of potash), a substance important as the principal ingradient in the manufacture of guipswider.—Caustic potash.—Lump-potash, the trade name for a crude potash containing about 6 per cent, of water.—Potash alum. The metallic base of the alkali potash, a substance not occurring uncombined in nature, but in various combinations widely diffused and of the highest importions widely diffused and of the highest importance. See polash. Potassium is silvery-white, and has a decided metallic luster. Its specific gravity is 0.876, and it is the lightest of all the metals with the exception of lithium. At the freezing-point of water it is brittle and has a crystalline fracture; at the ordinary temperature it is soft and may easily be cut with the knife. It was first obtained by Davy, in 1807, by the electrolysis of potash; but its preparation in the large way is effected by the ignition of a mixture of charceal and potassium earbonated in a moreury bottle or iron tube coated with clay. In perfectly pure and dry air it undergoes no change; but in ordinary air it soon becomes coated with

a film of potassium hydrate and carbonate. Its affinity for water is so great that when brought into contact with it immediate decomposition is effected, and sufficient heat evolved to set on fire the liberated hydrogen, which burns with the characteristic violet flame of potassium. Next to exist an and rubidium it is the most electropositive element. It is a most powerful reducing agent, and hence has been largely employed for separating other metals from their various combinations; but at the present time sodium, being cheaper, is more generally employed for that purpose. Among the most important saits of potassium are the eblorid or muriate, KCl, mined at Stassfurt, Germany, and used as a fertilizor as well as the starting-point for the manufacture of other potash-salts; potassium nitrate, KClO₂, which is used in the arts as an oxidizing agent and in the manufacture of explosives; potassium chlorid, which is used in medicine and protection nitrate, KCO₂, which, under the commercial names of potash, and is used in medicine and protecting in the manufacture of gunpowder; potassium chlorid, which is used in medicine and protectial names of potash and pearless, is largely used in the manufacture of soap and glass, and as a basis for making other potash-salts; potassium cylenide, KCN, a violent poison, used in photography and as a reducing agent; and potassium, more properly ethal-potassium carbonate, ClO₁, a violent poison, used in photography and as a reducing agent; and potassium, more properly ethal-potassium carbonate, ClO₁, a violent poison, used in photography and as a reducing agent; and potassium, more properly ethal-potassium carbonate, clon of carbon dioxid upon perfectly dry potassium hydrate in absolute alcohol.—Cobalticyanide of potassium-chlorate battery, an electric battery in which depolaries at lon of carbon dioxid upon perfectly dry potassium chlorate with subhurle acid.—Potassium cylenide, ferrocyanide, myronate, etc. See cyanide, etc.

[This was the original application of the name, and it is in this sense that the word is generally to be understood when used by English writers down to the middle of the seventeenth century.]

This Plant (which is called of some Siagrum Pernyianum, or Skyrrets of Poru) is generally of us called Potatue or Potato's. 2. One of the esculent tubers of the common plant Solanum tuberoums, or the plant itself. The potato is a native of the Andes, particularly in Chili and Peru, but in the variant boreal it reaches north to New Moxico. It was probably first introduced into Europe from the region of Quito by the Spaniards, about the indide of the sixteenth century. In 1646 it was brought to England from Virginia, where, however, it was probably derived from a Spanish source. Its progress in Europe was slow, its culture, even in Ireland, not becoming general till the middle of the eighteenth century; but it is now a stuple food in most temperate climates. The fruit of the potato-plant is a worthless green berry; its useful plant are small, but are much enlarged under cultivation. These tubers, which are of a roundish or oblong singe, sometimes flattish, are set with "eyes," really the axils of rudimentary leaves, containing ordinarily several buds, and it is by means of these that the plant is usually propagated. The food-value of the potato lies most-lived in starch, of which it contains from 16 to 20 or 25 percent. It is deficient in albuminoids and phosphates. Besides their ordinary food-use, potatoes are a source of manufactured starch; and spirits are now distilled from them to a considerable extent, chiefly in Germany. The tops (in America called vines, in England halms, in Scotland shawe) contain, together with the fruit, a poisonous alkaloid, solanin, absent in the tubers except when exposed to the sun. The varieties of the potato are numerous. The crop is often seriously injured by the potatobetel and the potato-rot. To distinguish it from the yellow sweet potato, this plant is sometimes called white potato.

Spanish potato, the sweet potato.—Sweet potato. (a) A plant of the convolvulus family, Ipomea Balalas, or one of its spindle-shaped fleshy esculent roots. The plant is a creeping, rarely twining, vine, with variously heartshaped, halberd-shaped, or triangular (sometimes cutlobed) leaves, and a blossom like that of the common morning-glory, but loss open, and rose-purple with a white border. Its value lies in the roots, which are richer in starch, and still more in sugar, than the common potato. Their use is very much that of the latter, but in Mexico they are made into a preserve. They are red, yellow, or white in different varieties, and range in weight from that of the common potato up to many pounds. A variety in the southern United States is called yem. The sweet potato appears to have originated in tropical America, but is referred by some to the East Indies, or to both emispheres. It is widely cultivated in warm climates, and is successfully grown in the United States as far north as New Jersey and Illinois, and even Michigan. In 1874 it reached the Atlantic coast at several points, and it has since been a peat in almost the entire country. It has several times made its way to Europe, but has been stamped out. Both larva and bestie feed upon the leaves of the potato, and the pupa is formed in the earth at the foot of the plant. There are three generations annually, and the perfect bestles hiperinate. potato-rot (pō-tā'tō-rot), n. A very destruc-tive disease of the potato, caused by a para-sitic fungus, *Phytophthora infestans*. It seems to sitic fungus, Phytophthora infestans. It seems to have been introduced from South America, about the year 1840, and since that time has been the cause of very serious beens, sometimes involving almost the entire crop. The fungus attacks the stem and leaves as well as the tubers, and when confined to the leaves and stem is usually called potato-bight. On the leaves it first appears as pale-yellowish spots, which soon turn brown and finally black, indicating the total destruction of the tissues. On the tubers the parasite attains a considerable growth within the tissues before there is any external manifestation of its presence. After a time depressed spots appear, and the skin covering these dies and becomes discolored. Under-

lying these spots the tissue will be found to be dark-colored to a considerable depth. The fiesh in the center of the tuber may remain for some time healthy and normal, but in the end it also decays, with either dry or wet rot. See Phytophthora and milder.

The bleaching reagent is chlorin dissolved in water, or chlorin generated in the mass by the action of dilute sulphuric acid upon a solution of common salt, or a solution of salt and chlorid of manganese, called bleaching-liquid. The stock is placed in a machine constructed much like a breaking or washing-engine, and called a potching-engine. The acid is very slowly dropped into the bleaching-liquid when the chlorin is to be generated in the mass, and, after the liberated chlorin has performed

its work, the stuff is discharged into stone or eartherware chests having sine strainers at the bottom, where the bleaching-liquid is drained off. When a solution of chlorin in water is used, it is added in proper quantity to the stock after washing, and the latter, after sufficient treatment, is drained as above described. (d) Specifically, in homeopathy, the power of a drug as induced by attenuation. Two scales of dilution or attenuation are employed, known as the contesimal and the decimal, the former being the one advocated by Hahnemann, and the latter of more recent introduction. In the decimal scale, one drop of the mother fincture is added to nine of the diluent, which is usually alcoholo, with earthan manipulations, and from this first decimal solution or potency one drop is taken, to form, with nine others of the diluent, the second decimal solution. This process is repeated till the required solution or potency is reached. Drugs of high potency are those of which the dilution has been frequently repeated, and the medicinal substance correspondingly attenuated; drugs of low potency, on the other hand, are those in a less diluted more concentrated condition. The thirtieth (centesimal) potency was the highest recommended by Hahnemann. 2. Powerdependent on external circumstances;

II. n. 1. Anything that may be possible; n possibility.—2. In dynamics: (a) The sum of the products of all the pairs of masses of a system, each product divided by the distance system, each product divided by the distance, the name to Green (1828) and independently to Gamas (1840). The potential is so called because its product by one constant differs only by another constant from the total via vice of the system. In case there is but one attracting point, the potential is the sum of the masses, each divided by its distance from the point. (b) More generally, the line-integral of the attractions of a conservative system from a fixed configuration to its actual configuration; the work that would be done by a system of attracting and repelling masses (obeying the law of energy) in moving from situations infinitely remote from one another (or from any other fixed situations) to other (or from any other fixed situations) to their netual situation. In this sense, the potential is the negative of the potential energy, to a constant proc. But some writers limit the use of the word to the case in which the bodies in (s. 1)-dimensional space attract one another inversely as the sth power of the distance. (c) In electrostatics, at any point near or within an electrified body, the quantity of work ne-cessary to bring a unit of positive electricity from an infinite distance to that point, the given distribution of electricity remaining unaltered. See *equipotential*. (d) A scalar quantity distributed through space in such a way that its slope represents a given vector quant ity distributed through space in such a way that its slope represents a given vector quantity distributed through space.—Difference of potentials. See difference.—Logarithmic potential, the potential for a force varying inversely as the distance. It is proportional to the logarithm of the distance, and is important in reference to the theory of functions.—Magnetic potential, at any point in a magnetic field, the quantity of work expended in bringing a positive unit magnetic pole from a given distance to that point.—Newtonian potential. See Neutonian.—Potential difference. —Rose as difference of potentials (which see, under difference).—Potential of dilatation, the function whose partial differential coefficients are the components of a dilatation.—Velocity potential, a scalar quantity such that the velocity of a mass of fluid in irrelational motion is everywhere equal to the slope of this quantity—that is to say, coincides in direction and in amount with the most rapid change of the value of the potential with the space. See slope.—Zero potential, in electrified bodies; practically, the potential of the carth, this being taken as an arbitrary zero, analogous to the sea-level in measuring altitudes. A loody which is positively electrified is said to be at a ligher potential, one negatively electrified at a lower, than the assumed zero of the carth. Potential in electricity is analogous to temperature; and, as heat tends to pass from a point at a higher to one at a lower temperature, so electricity time necessary for this equalization of potential of the resistance of the connecting conductor. Thus, an electrified bodies which will be determined by their original potential and their capacity. (See capacity.) The time necessary for this equalization of potential of the latter—the capacity of the earth being indefinitely great. If the difference of potentials between two connected bodies is kept up in any way — by the expenditure of mechanical work as in turning a Holtz machine, or of chemical energy as in a voltal

acterized by the numerous pistils on the dry recoptacle, styles not lengthened after flowering,

four or five bracts below the ealyx, and many stamens in a single row. The number of species has been estimated at from 180 to 280, most common in temperate and cold northern regions, only two being as yet known south of the equator. They are herbs or undershrubs, with mainly alternate pinnate or palmate leaves, adnate stipules, and usually white or yellow, often clustered, flowers, Several species are frequently called vide stravberry, as P. Canadensia in the Atlantic States and P. Fragariastrum in England, but, while they are often very much like the true strawberry. Fragaria, in habit, the latter is always different in its ficsly receptacle. (See cinqueful and frefinger.) Many brilliant-flowered species are occasional in cultivation, under the mane potentials. potestas (pō-tes'tas), n. [L., power: see potestate.] In Rom. antiq., personal sovereignty or dominion of a man over persons dependent on him; the authority which the head of a household possessed over wife, descendants, and slaves, as distinguished from official authority which the secondary and slaves. thority, called imperium: more specifically, such personal authority over children and descendants as members of the household (patria potestas, which see) and over slaves (dominica potestas, also called dominium), as distinguished from authority over a wife, ealled manus. The conception of potestas is substantially that of the patriarchal authority—consisting of the aggregate of the powers of punishment even to death, of control, and of disposal—which in early times the chief of the household has generally been allowed to exercise, the ground of this authority being connected with the fact that retributive justice dealt rather with the family than with individuals, and held the chief responsible for offenses committed by members of the household, and did not interfere with him in his discipline. Hence, potestas was often used as the equivalent of justor right, those who were subject to it being said to be alient juris, or under the right of mother, and those who were not subject to it an juris, or living in their own right.

In the English system, both in the more antiquated form retained in the United States and under the improvements established by the British government, two pounds are used—the pound actividupols (divided into 16 ounces) for all ordinary commodities, and the trop ound (divided into 12 ounces) for builton, and in the United States for a few other purposes. But, while troy ounces and their subdivisions are often used, the pound itself is hardly employed. In Great Britain and its colonies the legal original standard weight since 1886 has been the legal original standard weight since 1886 has been the legal original standard weight since 1886 has been the legal original standard weight in commercial pound." In the pound itself a beauty of the letters P. 8, stand for "Fullamentary Standard." The se-called "commercial pound" is only an ideal brass pound to be weighed in air. The troy pound in Great Britain is defined as 5,700 grains of which the avoirdupois pound contains 7,000. From 1821 to 1825 the only legal original standard weight in Great Britain was a troy pound contains 7,000. From 1821 to 1825 the only legal original standard weight in Great Britain was a troy pound contained 3,760. The present imperial pound avoirdupois pound weight legal standards were pound avoirdupois pound weight legal standards had been certain weights, both troy and avoirdupois, constructed under queon Elizabeth in 1888. This was the case with the ordinary pound of Geneva of 488.9 grams, which was equal to the silk-pound of Lyons. The silk-pound of Fatras in the Mores had also 15 ounces, but its value amounted to 480 grams. The 15-ounce merchants' pound of Kagland of 437 grams had ounces of the same value as the old 12-ounce moneyers' pound of the Saxons. 2. A money of account, consisting of 20 shillings, or 240 pence, originally equivalent to a pound weight of silver (or of the alloy used). It is usually discriminated from the pound weight by the epithet sterling. The pound Scots was equal to a twelfth

only of the pound sterling; it also was divided into 20 shillings, the shilling being worth only an English penny. In the currency of the American colonies the pound had different values: in New England and Virginia it was equal at the time of the Ravolution to 15s, sterling, or \$2.53; in New York and North Carolins, to 11s, 3d, sterling, or \$2.50; in New York, Pennsylvania, Delaware, and Maryland, to 12s, or \$2.65; in Georgia, to 18s, or \$4.00. These units of value did not at once disappear from local use on the adoption of the decimal system of coinage by the United States.

Prairial (pra'ri-al), n. [F., < prairie, a meadow: see prairie.] The ninth month in the French revolutionary calendar. In the year 1794 it began May 20th and ended June 18th.

prairie (pra'ri), n. [<F. prairie = Pr. pradaria = Sp. pradera, praderia = Pg. pradaria = It. pratoria, a meadow, < ML. prataria, meadow-land, prop. fem. of praturius, adj., < L. pratum, a meadow. Cf. prayere, prayell.] A meadow; level grassy land: a word frequently used by Homepin and other French writers in describing the practice of the prayers. describing the country adjacent to the Mississippi river, and now in common use, designating the level or slightly undulating treeless arons which cover a large part of Illinois, Wisconsin, Iowa, Minnesota, and other States further south. The prairies are never by the inhabitants of the prairie regions called plains, as are the treeless regions further west. They are characterised by a highly fertile soil, often of great thickness, and they often occur where the rainfall is oven considerably larger than on parts of the adjacent forest-covered regions. The cause of the absence of trees upon them cannot, therefore, be deficiency of moisture; in all probability it is the physical character of the soil, and especially its extreme theness, which renders it more suitable for the growth of the grasses than for that of arboreal vegetation. In the extreme northwestern region of the United States, especially in Montains, cortain level treeless areas surrounded by the mountains are now by some called prairies: some of these had been previously denominated Acles. Further south in the Rocky Mountains they are known as parks, or sometimes as besins. See hole!, 6, and plain! sin, Iowa, Minnesota, and other States further

The precise alluded to was one of those small natural meadows, or pastures, that are to be found in Michigan, and may have contained four or five thousand acres of open land.

Brairie-hen (prā'ri-hen), n. (a) The pinnated grouse, Cupidonia or Tympanuchus cupido, a gallinaceous bird of North America belonging to the family Tetraonides; or (b) the sharp-tailed grouse, Pediacetes phasianellus columbianus.

See cuts under Cupidonia and Pediacetes. The range of these two different birds, though somewhat overlapping, especially of late years, is complementary. The true prairie-hen or pinnated grouse belongs properly to the fertile prairies of the United Status, especially Illinois, Iowa, Missouri, the eastern half of Minnesota, South Dakota (especially eastward), middle and eastern Kansas and Nebraska, Arkansas, and eastern Texas. It also still lingers in some localities in the Middle Status and New England; but with the settlement of the country it has followed the railroads, as these have been pushed westward and northwestward, to the Booky Mountains and far up the Missouri river. The sharp-tailed grouse, the prairie-hen or -chicken of the Northwest, locally called whitebelly, is a bird of more arid regions, resembling the sage-grouse in this respect, and its eastward range has contracted with the extension of the pinnated grouse westward. It is found in suitable country of the central placua to the Sierra Nevadas of California and the Cascade ranges of Oregon and Washington, and northward in much of British America, where it occurs in its typical form, Profecetes phasianelius, as distinguished from the United States variety called ossemblense.

Tennyson, Maud, xxvii. 5. A form of religious service; a religious observance, either public or private, consisting mainly of prayer to God; a liturgy: often in

the plural: as, the service of morning prayer; family prayers. She went from opers, park, assembly, play, To morning walks, and *prayers* three hours a-day. *Pops*, To Miss Blount, ii.

Prayers and calling-over seemed twice as short as usual.

T. Hughes, Tom Brown at Rugby, 1. 8.

6. That part of a memorial or petition to a public body, or of a bill of complaint in equity, which specifies the thing desired to be done or granted, as distinct from the recital of facts or which specifies the thing desired to be done or granted, as distinct from the rocital of facts or reasons for the grant.—Apostleship of prayer, See spottsakly.—Book of Common Prayer, the book containing the appointed forms for public worship and for the words and acts used in the rites and ceremonies of the Church of England, or a similar book authorized by one of the other branches of the Anglican Church: briefly and popularly known as the Prayer-book. After the publication in English of the Litany in 1544, and of the parts of the communion office relating to the communion of the people in 1548, the First Book of Common Prayer was issued in 1549, the second year of Edward VI. Almost the whole book is taken from the medieval liturgical books, especially the missal, portiforium (breviary), and manual seconding to the Use of Sarum (see use), but with omissions, condensations, and the addition of a number of addresses to the people. English was substituted for Latin, all the offices were united in one book, and a uniform use was established for the whole Church of England. Successive revisions were made in 1562, 1569, and 1662. The greatest changes were those introduced in the Recond Prayer-book of Edward VI. (1562), especially in the communion office (see communion) and at confirmation and burial. This book never came into actual use, but was in the main followed in the revision under Elisabeth in 1569 and in the present English book as issued in 1609, after the restoration of Charles II., but with material modifications, especially in 1662, returning toward the standard of 1549. The Prayerbook authorized in 1837 for use in Rocitand, and differing from the English book mainly in the communion office, met with serious opposition at the time, but came into use atterward in the Roctac Englishopal Church. The American Prayer-book, authorized in 1789, differs from the English mainly in the communion of the Athanasian Creed and of the form of private absolution in the visitation of the sick, the restoration of the grea consecration of churches and institution or ministers.
In 1880 a new revision was begun, resulting chiefly in a return to the English book in several points: this revision was completed in 1892. The Psalter, Ordinal, and Thirty-nine Articles are always bound with the Book of Common Prayer, and usually considered parts of it,

though technically spaking they are distinct from it.

Prayer of humble access. See access.—The long prayer, in non-litturgical churches, the chief prayer of the service. It is usually offered just before the sermon, or before the hymn preparatory to the sermon. Also called postoral prayer.—To lead in prayer. See lead!.—Syn. Prayer, Fettion, Request, Entreaty, Supplication, Suit, Appat, Invention, orison. Prayer is always addressed to died, but a prayer may be addressed to a sovereign, legislative hody, court, or the like, always to a person or body recognized as having authority in some way, and asking for something especially important. A petition may be a single point in a prayer: thus, the Lord's Prayer contains one address, three loyal desires, four petitions, and a clomage something ascription. A petition may also be a formal and public request or prayer, but still generally covering only a single thing desired. Housest is the most general and least forcible of these words, indicating nothing as to the degree of formality of the act or as to the rank of the persons concerned. An entreaty is an urgent, perhapt bender, request, generally from and to a person. A supplication is still more urgent, the request being made with passion, and humbly, as to a superior. The word entreaty is not often followed by the mention of that which is desired, but may be as a streamy for a suit at law. An appeal is an urgent request, of the nature of a call or demand. The good precedence. Shakt, A. and C., il. 5. 51.

Order of precedence, the whole body of rules which fix gradation of rank, especially with regard to the right of certain officials and persons of rank to a prescribed place in any ceremony. In Great Britain precedence is formed by statute, patent, or usage, but the chief regulations regarding the order of precedonce were setted by Parliament in the reign of Henry VIII. Some of the leading rules are thus summarized from Burke: precedence is conferred by men's rank; men of official rank who have higher personal precedence are placed according to that precedence are placed according to that precedence from a fright of the dates of patents; younger sons of persons of higher rank come after eldest sons of persons of higher rank come after eldest sons of persons of next lower rank; daughters of peers, baronets, etc., rank after the wives of their eldest brothers; wives and children of great officers of state have no consequent precedence; a lady having precedence by birth retains her precedence although married to a commoner; haronets rank according to dates of their patents; ambassadors rank after members of royal families, ministers and envoys after dukes.—Patent of precedence, a grant from the crown to such barristers as it thinks proper to honor with that mark of distinction, whereby they are entitled to such rank and presudience as are assigned in their respective patents.—Personal precedence, precedence of, right of birth or family, as distinguished from that which is conferred by official position.—To take precedence in right of birth or family, as distinguished from that which is onferred by officer. Pope, Dunciad, i. 277.

2. [cap. or l. c.] In liturgies, the introductory section of the anaphora; the solemn eucharistic thanksgiving and ascription of glory introducing the canon. The Preface is found of the same type in all liturgies. It begins with the Sursum Cords, generally preceded in early and Oriental forms by the apostolic (2 Cor. xiii. 14) or a similar benediction. After an exhortation to give thanks (Response: "It is meet and right...", the Preface in the narrower sense begins with the affirmation (contestation) "It is very [truly] meet, etc., to give thanks..." The reason for thankfulness is given in the central division of the form. This in early and oriental liturgies is invariable, and still retains much of its original character of an extended ascription of glory to God and rehearsal of his dealings with man from the Creation and Fall onward. In Western liturgies a number of proper Prafaces is provided, varying according to the day or season. Probably these were originally sections of the primitive Preface or of the earlier part of the Oanon, selected as appropriate to the season or modeled on such sections. The Proface terminates with the Sanctus. Also, in Gallican uses, contestation, illation, immolation.

The preface is one of the most ancient, as it is one of thanksgiving and ascription of glory introdu-

A governor, commander, chief magistrate, or superintendent. Specifically—(a) A name common to several officers, military and civil, in ancient Rome, who held particular commands or had charge of certain departments. Thus, the prefect or warden of the city at first exercised within the

city the powers of the king or consuls during their absence; after 487 E. C., as a permanent elective magistrate, he was empowered to maintain peace and order in the city. After 346 E. C., when the first practor orbenses was appointed, the importance of the prefect's office vanished; but its judicial functions were much enlarged by Augustus. Under Constantine the profects were direct representatives of the emperor's person, civil governors of provinces or of chief cities. The title of prefect was also given to the commander of the fleet and to the commander of the prefect and to the commander of the prefect and conservers of the chief officials and magistrates. (b) The chief administrative official of a department of France; a prefect. The office dates from the year 1800; the prefect is appointed by the head of the state, and is the intermediary between the department and the central government; he is charged with the execution of the laws, with the superintendence of the police and of the administration, with the appointment of many minor officers, etc. He is assisted by the council of prefecture and the general council. II. n. A milk-molar; a molar of the deciduof gamopetalous shrubs and trees of the order

II. n. A milk-molar; a molar of the deciduous dentition; a tooth which in the permanent dentition replaces a milk-molar. Such teeth occur as a rule in mammals which have a diphyodont dentition. All the molars or grinders of the first set are technically premolars, and all those which succeed and replace them in the second set are also premolars, whatever their size, form, or number. They are usually smaller than true molars, and also less complicated in structure; but such distinctions do not hold in every case. Premolars are developed in an anterior partof the maxillary bone, and, when they coexist with true molars, are always situated in front of the latter. The first, foremost, or most anterior premolar soften specialised, and is then known as the cosme. Excepting this tooth, the typical though not the most frequent number of premolars is three above and below on each side; there are rarely more than three, oftenest two, as in man; sometimes one or none, as in redents. The two premolars of man are commonly called biomptifs. In dental formulas the symbol of premolar is pna or p. The premolar formula of man is pns. $\frac{2-2}{2-2}$.

8. In anat., an animal body or any part of it prepared for anatomical purposes, or preserved to display parts already dissected. Preparations are roughly divided into dry and sect. A wet preparation is immersed in a preservative field, usually alcohol, often glycerin, sometimes chlorid of zinc. Dry preparations are of more varied character: a skeletom is a familiar example. Microscopic preparations are osselly thin allows or sections permanently mounted on alides. All preparations are specimens, but a specimen may be a natural object upon which no work has been done, while preparation implies some special steps taken for display or preservation, or both. Models in wax and papier-maché are often called preparations.

9. In counterpoint and strict musical composition generally: (a) that treatment of the

sition generally: (a) that treatment of the voice-parts whereby a dissonance in any chord is introduced as a consonance in the preced-ing chord, and simply held over into the dissonant chord by its own voice-part, while the others move; (b) a consonant tone in any voice-part which is thus about to become a voice-part which is thus about to become a dissonance. In early counterpoint no dissonances were permitted; later, they were admitted as suspensions (see suspensions)—that is, consonances held over into chords with which they are at first dissonant; next, they were allowed whenever thus prepared or foreshadowed, whether resolved as suspensions or not. In free writing, dissonances are often abrupily introduced without previous sounding. Preparation is opposed to percussion, and to resolution, which is the final merging of the dissonance into a consonant chord.

The style of painting in vogue from the time
of Giotto (died 1336) to that of Raphael (a celebrated Italian painter, 1483-1520); specifically,
a modern revival of this style. The essential characteristic of the revived style is rigid adherence to natural
form and effect, and consequent rejection of all effort to
elevate or heighten the effect artificially, by modifications,
whether in drawing, arrangement, or coloring, based on
conventional rules. The name is also given to the application of similar principles in poetical composition, shown in
attention to minute details.

Of or pertaining to eccleviastical government by elders or by presbyterium. is presbytery, I.I.. presbyter, a presbyter: see presbytery, preabyter.] I. a. Of or pertaining to ecclesiastical government by elders or by presbyteries. The word is specially used to note the various religious bedies which adopt the Presbyterian form of church government (see Presbyteriansm), and hold a more or less medified form of Calvinism. Among the leading Presbyterian churches are the following: (1) The established Church of Scotland, formed in 1560 under the leadership of Knox; it prepared the First Book of Discipline in 1560, the Second Book of Discipline in 1560, the was formally established by the government in 1562. It was temporarily replaced by episcopacy during the period 1661-89. Later events were secessions leading to the formation of various bodies in the cighteenth century (Secession Church in 1783, Relief Church in 1761) and of the Free Church in 1843. See Commanter, 2. (2) The Presbyterian Church in 1845. See Commanter, 2. (2) The Presbyterian Church in 1845. See Commanter, 2. (2) The Presbyterian Church in the United States. Its first presbytery was founded in 1706. After a temporary disruption, the first General Assembly met in 1789. In 1838 the church split on theology and the antislavery question. (See New School and Old School, etc., below.) The two wings were reunited in 1870. It numbers about 900,000 members. (3) The Presbyterian Church in the United States (Kouthern). This body secended from the Old School Presbyterian Church in 1891 on the establishment of the Confederacy, and during the period 1861-5 it had the title of General Assembly of the Confederate States of America. It numbers about 200,000 members. Other bodies, besides the Free Church of Scotland (see free), and those mentioned below, are the Reformed Presbyterian Church, the Presbyterian Church, the Presbyterian Church, the Presbyterian Church, the Presbyterian Church in the United States, and was developed from the Cumberland presbytery in Kentacky and Tennessee in 1810. It numbers about 180,000 members. New School Pr

terian churches.

Presbyterianism (pres-bi-të'ri-an-izm), n. [= F. presbyterianisme = Sp. presbiterianismo = Pg. presbyterianismo; as Presbyterian + -ism.] The system of church government by elders or The system of church government by elders or by presbyteries. The essential features of church government in Presbyterianism are—the equality of the clergy, the identification of the apostolic presbyter with the bishop, the division of elders into teaching elders (or aninisters) and ruling or lay olders, the government of each local church by its session, composed of pastor and ruling elders, and the subordination of sessions to a presbytery, of presbyteries to a synod, and of synods to a general assembly. In the Dutch Raformed Church, which adopts Presbyterianism, the bodies corresponding to session, presbytery, synod, and general assembly are consistery, classis, synod, and independency on the other. It was developed in the sixteenth century by Calvin and other reformers, and

was adopted in Geneva and by the reformers in France, Scotland, etc. It supplanted episcopacy for a short time in England, in the period of the Civil war and Commonwealth. I resbyterianism is the predominating form of church government in Scotland, and prevails extensively in the Netherlands, in the United States, and in Ireland and other parts of the British emptre.

— Syn. 1. Present, Gift, Donation, Gratuity, Largess, Grant. The difference between present and gift is felt in the fact that one may be willing to accept as a point: a gift is to help the one receiving it: a present does him honor, or expresses friendly feeling toward him. A present is therefore ordinarily to an individual; but in law gift is used, to the exclusion of present, as including all transfers of property without consideration and for the benefit of the donce. A donation is of considerable value, and generally made to some public institution: as, a donation of books to a public library. Gratuity emphasizes the fact that the receiver has no legal clain to the gift; it is a gift to an inferior, as a fee to a servant, and generally a small sum: as, a self-respecting man will not expect a gratuity for every little service. Largess is an old word, representing a gift from a superior, especially one high in authority, generally shared by a considerable number. A grant is rarely the act of a private individual, but rather of a soverign, legilature, or corporation: as, a grant of land to a company.

presenta bility (pre-zen-ta-bil'i-ti), n. [< pre-sentable + -ity (see -bility).] The state or quality of being presentable.

positions. See position, 10. 7. A cognitive modification of consciousness; 7. A cognitive modification of consciousness; an idea; a representation. This use of the word has recently been introduced to translate the German constelling, the term used by Wolff to translate the Latin representatio. Nome of these words has ever been scientifically defined, and they are used, like their synonym idea, with vague variations of meaning. Of these, the following appear to be types: (a) An idea in general; any mental object subject to attention and association. Kant divides presentations (word-llungen) in this sense into unconscious presentations and perceptions, the latter into sensations and concepts, and the latter into empirical and pure concepts.

All that worlds of mental facts which we mask of as

cepts, and the latter into empirical and pure concepts.

All that variety of mental facts which we speak of as aemsations, perceptions, images, intuitions, concepts, notions, have two characteristics in common: (1) they admit of being more or less attended to, and (2) can be reproduced and associated together. It is here proposed to use the term presentation to connote such a mental fact, and as the best English equivalent for what Locke meant by idea and what Kant and Herbart called a Vorstellung.

J. Ward, Energy, Britt, XX. 41.

(b) A figurate conception; a product of the imagination.

(e) A ngurate conception; a product of the magnation.

The term presentation [German varietlung], which Hegel employs to name these "picture-thoughts" or "figurate conceptions," corresponds to the facts of their nature. A presentation is one of two things: either a particular thing taken under general aspects, or a universal inarrowed down to a particular thing. Thus, as it has been seen, a general name expresses a universal relation or attribute, but confines it to a particular object or class.

Wallace, Prolegomena to Hegel's Logic, Xii.

(c) A direct percept; a presentative cognition.

The percept involves the immediate assurance of the presence of the whole object. Hence, psychologists speak of percepts in their totality as presentations. Sully, Psychology, vi.

Tennyon, In Memoriam, exix.

2. In mech.: (a) An equilibrated force.

Experience . . . showed that the pressures of a vanit cannot be concentrated upon any single point, but only upon a line which extends over a considerable partion of the pier from the springing point upwards.

C. H. Moore, Gothic Architecture, p. 81.

(b) A force per unit area exerted over the sur-(b) A force per unit area exerted over the surface of a body or part of a body, and toward the interior of the body. A force exerted upon a surface is necessarily equilibrated; otherwise, since the surface has no mass, it would produce infinite velocity until equilibrium ensued. A pressure can produce no motion, because it is a state of equilibrium; but a continuous variation of pressure in a given direction will tend to produce motion toward the places of less pressure. Thus, if a cylinder of liquid in a tube is under greater pressure per equare inch at one end than at the other, there will be a tendency to notion toward the end where the pressure is less. (c) Streass in general, being either thrust, pull, or Stress in general, being either thrust, pull, or shearing stress. For axis of pressure, conjugate pressure, and other phrases where pressure means stress, see the latter word.

Boyle discovered a law about the dependence of the pressure of a gas upon its volume, which showed that if you aqueeze a gas into a smaller place it will press so much the more as the space has been diminished.

W. E. Chiford, Lectures, I. 180.

Uniform pressure, . . . such as the atmospheric, and, in a less degree, that of our bodily parts and of our clothes, produces no distinct consciousness.

Absolute pressure. See absolute.—Absolute steam pressure, the total pressure computed from the zero of an absolute vacuum: distinguished from relative pressure, or from pressure indicated in pounds, kilograms, or other measure of weight above the ordinary atmospheric pressure at the sea-level. Ordinary steam-gages indicate pressure above that of the atmosphere. To the pressure a indicated the pressure of the atmosphere must be added to obtain the absolute steam pressure.—Atmospheric pressure. See atmosphere, 2.—Center of pressure. (a) In physics, that point of a body at which the whole amount of pressure may be applied with the same effect it would produce if distributed. (b) Specifically, in Agdros, that point of a plane, or of the side of a vessel containing a liquid, to which if a force were applied equal to the total pressure and in the opposite direction, it would exactly balance the total pressure.—High pressure. (a) Formerly, a phrase noting all steam-engines working at preference metrally higher than atmospheric pressure. (b) Figuratively, a high degree of mental tension.

Miss Squeers.—was ... taken with one or two

Miss Squeers . . . was . . . taken with one or two chokes and catchings of breath, indicative of feelings at a high pressure.

Diokena, Nicholas Nickieby, zii.

Intensity of a pressure. See intensity.—Low pressure, in steam-engines, a phraso noting a motor using steam at a comparatively small pressure. The precise signification of the term is undetermined, but the standard of pressure is steadily rising, so that engines that were formerly considered high-pressure are now looked upon as low-pressure engines. The phrase formerly implied, the pressure of a condenser and pressure of not more than six pounds above atmospheric pressure, but it now has reference solely to the pressure, and describes that only relatively.—Pressure myellitis, myelitis due to compression of the spinal cord, as by a tumor.—Pressure of atmosphere. See atmosphere, 2.

pressure-figure (presh'ūr-fig'ūr), m. In min-eral, a figure produced in a section of some minerals by the pressure of a rather sharp point: thus, upon a sheet of mica the pressure-figure has the form of a six-rayed star, which is diagonal in position to the more easily obtained percussion-figure — that is, its rays are normal to edges of the prism and clinopinacoid.

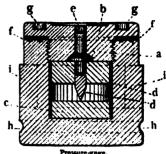

pressure-filter (presh'ūr-fil'ter), n. A filter in which the liquid to be filtered is forced through

which the liquid to be filtered is forced through filtering material by pressure greater than that of its own weight in the filter. Positive increase of the difference between the pressure on the liquid surface and against the discharge outlet is effected either by forcing air into an inclosed space over the liquid, by increasing the head through use of a standpipe, or by decreasing the atmospheric pressure upon the discharge outlet. pressure-forging (presh' fir-för' jing), n. A method of shaping metal in dies in a forging-press by means of great pressure, usually hydraulic; hydraulic forging.

pressure-gage (presh'fir-gaj), n. 1. An apparatus or attachment for indicating the pressure of steam in a boiler.—2. In gun., an instru-

er" gage. With the two cutter-gages, the lengths of the indentations in the soft copper disks are measured and compared with cuts of the same length made in the testing-machine by the same cutters. From the tests in the machine, a table of lengths of cuts, with the pressure sequired to produce them, is made up. Hence, measuring the indentation in the disk taken from the pressure-gage, and turning to this table, the pressure exerted by the powder in the bore of the gun will be found opposite the measured length. The disks used in the pressure-gage and in the testing-machine should be taken from the same bar of copper, in order to secure a uniform density. In the "crusher" gage, the diminution in length of the copper cylinder is measured, and the pressure found by the testing-machine to produce an equal reduction in length of a cylinder from the same copper is assumed to be that exerted upon the bore of the gun. Pressure-gages may be placed either in a cavity in the walls of a gun or in the base of the cartridge-bag carrying the charge of powder.

5. In law, an inference as to the existence of one fact from the existence of some other fact, founded upon a previous experience of their connection, or dictated by the policy of the law. Presumptions are generally inferences in accordance with the common experience of mankind and the established principles of logic; but, as they differ in cogency or con-

vincing power, the term is used variously as signifying different degrees of certainty in the inference. (a) An inference which a jury, or a judge sitting in the place of a jury, may without error draw from a given state of facts, but is not bound to draw from them: called by way of distinction a presumption of fact. (b) An inference which, in absence of evidence to the contrary, the law draws, and a jury or judge cannot without error refuse to apply: called by way of distinction a least presemption or a presumption of law; more specifically, a rebuttable legal presumption. (c) An inference which the law, usually for reasons of public policy, draws from a given state of facts, and refuses to allow evidence to countervall the inference: called a cenclusive presumption or an irrebuttable presumption. (See conclusion.) Thus an infant under 7 is conclusively presumed incapable of criminal intent, and the law will not allow evidence to be received that he was preconclously capable of it. An infant between 7 and 14 (by statute now in New York 12) is presumptively incapable of such intent, but this, though a presumption of law which cannot be diaregarded in the absence of evidence, may be rebutted by evidence of actual capacity. An infant over that age shown to be untaught and dull of comprehension might be inferred to be without such capacity, but this inference (unless the evidence was clear) would be only a presumption of fact, which the jury alone could draw, and the court could not control.—Philosophical or logical presumption, etc. (see errogates), assurance, effortery, forwardness. See presumptummens.—2. Surmise, Conjecture, etc. See inference.—4. Likelihood, probability.

Becutcheon of pretense. See seastcheon.—False pretense, a false representation as to a matter of fact, made in order to induce another to part with property, and with intent to cheat: commonly in the plural.—Bidled of pretense, an inescutcheon borne to assert the owner's pretensions to an estate; an escutcheon of pretense.—Statute of false pretenses. See statute.—Syn. 2. Pretenses, Pretent, Pretension, mask, color, excuse, simulation, affectation, cant, claptrap, subterfuge, evasion. A pretense is the holding forth of that which is false: as, his grief, admiration of a picture, plety, was all a pretense; selfish or ultarior purposes may be connected with the matter, but not necessarily so: as, to obtain money under false pretense. A pretent has something else in view, and makes it seem right or natural, or hides it out of sight; the man whose friendship is mere pretense will trump up some pretext to escape from each claim upon him for help. That which is used as a pretent may or may not exist. A pretension is a claim advanced or asserted, or a holding out of an appearance: as, pretensions to wealth, learning, respectably. Pretense and pretext of course ordinarily express that which is wrong; they may be lightly used of that which is proper.

3. Specifically, in hierarchical churches, the second in rank in the clerical orders, between bishop and deacon. Etymologically, the word priss is a derivative or modification of the word priss is a derivative or modification of the word priss is a however, the office of the presbyterate has been regarded in the Christian church from primitive or early times as a sacerdotal office in so far as it confers power to celebrate the entential and to confer absolution, and as no church officer below a presbyter can exercise these functions, and all above a presbyter contrible to exercise them in virtue of their ordination as presbyters, the title of presbyter and that of sacerdos or input (sacrificing priest) soon came to the regarded as synonymous, and either one or the other of those titles to be preferred in popular use in different languages, to the exclusion of its synonym. The title of priest (ερεύς, sacerdos) was in the early church given by predminence to the bishop (specifically the high priest) as ordinary celebrant of the sucharist in cities and the fountain of sacerdotal authority. The Roman Catholic Church teaches that it is the office of a priest "tooffer, bless, rule, preach, and beptise." These same offices are assigned to priests in the Orthodox Greek and other Oriental churches and in the Anglican Church. In the church last named the form of ordination gives authority to forgive or retain sins and be a dispenser of the word and sacraments, and only priests (including bishops as in priest's orders) can give benediction, pronounce absolution, and consecrate the eucharist.

The title of primate did not come into ordinary use till the ninth century, after which it was given to metropolitans of certain sees as special representatives of the Pope. The term primate (paperciae) has never been in regular use in the Greek Church. The title of averak comes nearest to it. In the Roman Catholic Church a primate is a bishop or an archbishop to whom is delegated a certain jurisdiction as vicar of the Pope over the bishops of his province, or to whose see such authority has formerly been delegated. In the Church of England the Archbishop of Cantarbury has the church of England. In the Church of Iroland the Archbishop of Armagh is Primate of all Iroland, and the Archbishop of Dublin Primate of Iroland. It [Lyons] is the seat of an Archbishop, who is the Pri-

3. In zoöl., a member of the order Primates; a primatial or primatic mammal, as man.

Frimates (pri-mā'tēz), **. pl. [NL., pl. of LL. primas (primat-), of the first or chief: see pri-

mate.] 1t. The first Linnean order of Mammatia, composed of the four genera Homo, Simia, Lemur, and Vespertitio, or man, monkeys, le-murs, and bats.—2. Now, the first or highest order of Mammalia, including man, monkeys, in murs, and bats.—2. Now, the first or highest order of Mummalia, including man, monkeys, and lemurs. The brain has a relatively large cerebrum, overlapping much or all of the cerebellum and of the olfactory lobes, with usually a highly convoluted surface; there is a well-defined calcarine suicus, and a hippocampus minor in the postcornu; the corpus callosum extends backward to the vertical of the hippocampal suicus, and develops in front a well-marked recurved rostrum. The periotic and tympanic bones are normally joined to the squamosal. The pelvis and the postcrior limbs are well developed, and the legs are exserted almost entirely beyond the common integument of the trunk. The first or inner digit of the foot, the great toe, is enlarged, provided with a nail (not a claw) and usually apposable to the other digits. Clavicles are present and perfect. There are teeth of three kinds, all enameled, and the molars have mostly two or three roots. The placenta is discoid and deciduate. The Primates correspond to the Binana and Quadrumana together. They are divisible into two suborders, the Anthropoidez and Prosimies, the former represented by the families Homindes, Simides, Cynopthecides, Cebids, and Midides, or man and all kinds of monkeys—the Prosimies, or lemurs and lemuroid animals, constituting the families Lemurides, Tarsides, and Deubentonides. 5. In fenoing: (a) The first of eight parries or guards against thrusts in sword-play, afterward retained in exercise with the foils: the first guard a swordsman surprised by an atfirst guard a swordsman surprised by an attack could make, while drawing his weapon from the scabbard near his left thigh. It was followed by parries in seconds, tieres, quarts, up to octave, according as thrusts followed at the openings in the decrease made by such guards. In prime guard the point remains low, the hand higher than the eyes, as in drawing the sword, and the knuckles are upward. It is the ordinary position of the German student "on guard," when fencing with the schläger. Hence—(b) Sometimes, the first and simplest thrust (and parry) which can be made after two fencers have which can be made after two fencers have crossed foils and are "on guard" with the left sides of their foils touching: used thus for the sides of their folls touching: used thus for the direct thrust. This is by some writers called modern prime, while the true prime is called assisted or old prime. In both old and modern prime the word prime is used to indicate the thrust as well as the parry or guard; but this comes from suppression of "in": thus, prime thrust, for thrust in prime. Prime, seconds, etc., represent numbered sections of an ideal chart covering such parts of a swordsman's trunk as are visible to his opponent, each of which sections is supposed to be guarded by the parry thus numbered. Honce the meaning of a "thrust in prime," etc.

(d) In a scale, the first tone; the tonic or key-(d) In a scale, the first tone; the tenic or keynote. The typical interval of the prime is the unison, accustically represented by the ratio 1:1; such a prime is called perfect or major. A prime in which one tone is a half-step above the other is called asymmetric or superfumes. The perfect prime is the most perfect of all consumances—so perfect, indeed, that in its ideal form it is better described as a unison than as a consonance. In harmony, the parallel motion of two voices in perfect primes is forbidden, except when a strictly melodic effect is desired; such primes are called consecutive. Compare consecutives fifth and consecutive cotave, under consecutive.

New England Primer (ed. 1777), Title. Specifically (eccles.), in England, both before and after the Reformation, a book of private devotions, especially one authorised by the church and partially or wholly in the vernacular, containing devotions for the hours, the Creed, the Lord's Prayer, the Ten Commandments, certain pealms, instruction as to elements of Christian knowledge, etc. Primers are extant dating from the fourteenth century and earlier. A reformed primer was set forth under Henry VIII. In 1545, and continued in use with alterations till 1575. A new series of primers began in 1853, and unauthorised primers were also often issued. Books of devotion closely resembling the old primers in contents and character are extensively used among Anglicans at the present day.

they were embedded that their determination was a matter of doubt. Many of the rocks formerly called primitive are now known to be more or less thortoughly metamorphosed Paleonic strate, and in the progress of geological investigation they have been referred to their place in the series of stratified formations. Other so-called priestive rocks belong to the sacio or archaet series (as this latter term was and still is used by Dana)—time is, they unmistakably underlie unconformably the oldest known fossiliferous strata. These sacio rocks are made up in part of eruptive masses, and in part of highly metamorphosed sedimentary deposits which, so far as can be determined from existing evidence, were deposited before the appearance of life on the earth. As there is much printing rock of which the geological age has not as yet been fixed, it has been found convenient to designate this simply as the strategies or metamorphic; such rocks are, however, often called archaen; but this cannot be properly done until their infra-Silurian position has been established by obervation. they were embedded that their determination

Aristodemus . . . died leaving twin sons, Eurysthenes and Procles; their mother refusing to determine which had the right of prisagensture, it was agreed that both should succeed to the crown with equal authority.

J. Adams, Works, IV. 549.

Descent to the eldest son; the principle or right by which (under the Norman law intro-duced into England) the oldest son of a family succeeds to the father's real estate in prefersucceeds to the father's real estate in preference to, and to the absolute exclusion of, the younger sons and daughters. The ancient customs of gavelkind and borough English form exceptions to the general rule of law as to primogeniture. (See generaling and borough English.) In the modified form of the law of primogeniture now existing in England, the law, if left to operate, carries the land of a person dying to make heirs singly, in succession preferring the eldest, but to female heirs equally in common, and carries personalty to wife and children with no preference for the eldest son. He was the first-born of the Almighty, and so, by the title of primopentture, heir of all things.

South, Sermons, IV. z.

The abolition of primogeniture, and equal partition of inheritances, removed the feudal and unnatural distinctions which made one member of every family rich and all the rest poor, substituting equal partition, the best of all agrarian laws. *Jeferon, Autobiog., p. 40.

Primogeniture, as we know it in our law, had rather a political than a civil origin, and comes from the authority of the foudal lord and probably from that of the tribal chief; but here and there on the Continent there are traces of it as a civil institution, and in such cases the succession of the eldest son does not exclude provision for the younger sons by what are called appanages.

*Maine, Early Law and Custom, p. 261.

*Representative primogeniture, the rule of foudal in-

Representative primogeniture, the rule of feudal inheritance by which the issue of a deceased child were regarded as standing in the place of that child, subject to the same preference of males over females among them, and of elder over younger males among them, as obtained among children inheriting directly: so that, if an elder own died leaving sons and daughters, the eldest of the sons would take what his father, if living, would have taken.

In geol., containing the earliest traces of life.

Of all the results of geological and paleontological investigation during the past half-century, there is no one ao remarkable as the revelation of the existence of the so-called primordied suns. It is now clearly established that there was a time when life was represented by a few forms, which were essentially the same all over the globe. What has long been known to be true for Europe and America has been recently supplemented, for Asia, by the investigations of Richthofen in China, where the peculiar primordied fanna seems to be largely developed, bearing, as Professor Dames remarks, "an astonishing resemblance to that of North America and Scandinavia.

Primula (prim'ū-lā), n. [Nl. (Malpiglii, 1675), (ML. primula, primrose (so called in allusion to its early blooming), fem. of L. primulus, first, dim. of primus, first: see prime. Cf. primerole, primrose.] 1. A genus of gamopetulous
plants, the primroses, type of the order Primulaces and the tribe Primulose, characterized by a conspicuous salver-shaped corolla, with five opposite stamens borne on its long tube, and by a roundish five-valved and one-celled capsule, containing many peltate seeds. There are about 130 species, mainly mountain-dwellers of Europe

Plowering Plant of Primula Sinensis.

and Asia, with 5 in the United States, 1 in extreme South America, and 1 in the mountains of Java. They are beau-tiful low-growing plants, with perennial rootstocks. The

leaves are all radical, obovate or roundish, entire or testined, and form a spreading tarit. The flowers are dimerphona, some having a short style and stamens borne high up on the tube, others opposite in both respects. They are white, pink, purple, or yellow in color, grouped in bracted umbels—in the true primrose, however, appearing as if on separate stalks. The common P. serie of Europe and northern Asia, claswhere in gardens, with yellow or straw-colored flowers in carry spring, has three varieties, often regarded asspecies, corresponding to the names primate (P. valgaria), county or pagic (P. verie), and calle (P. clattor). It is, however, generally believed that P. slatter is a good species, indigenous, though rare, in England, called Rarafield calle; and, according to Darwin, P. valgaria and P. verie are also distinct, while the common oxing is a hybrid between thom. (See the shove common names, and herb-peter (St. Peters-vert), lady-bay, petty multar (under mullen), and palaport.) Numerous other species are beautiful and more or less cultivated. See surfaula basiers, bears-e-ers, dusty-miller, French counting (under counting), polyanthus, and primeros.

2. [l. c.] Any plant of the genus Primula.

Primulaces (prim-\hat{\text{i}}-\hat{\text{i}}-\hat{\text{o}}-\hat{\text{i}}, n. pl. [NL. (Ventenat, 1799), Primula + -accs.] A very distinct order of gamopetalous herbs of the cohort Primulalos, characterized by its five stamens convenit to the five lobes of the regulax oppolia

Primulales, characterized by its five stamens opposite to the five lobes of the regular corolla, and the capsular ovary containing two or more ovules, a single style, and an undivided stigma; the primrose family. It includes about 315 species, classed under 4 tribes and 25 genera, natives of temperate regions and mainly alpine, rare in the southern hemisphere. They are herbs, growing usually from a perennial rootstock; the few that occur in the tropics become there annuals, an inversion of the usual effect of the tropics. They bear undivided or rarely lobed leaves, either all radical, or alternate, opposite, or whorled; and commonly racemed, umbeled, or long-stalked flowers. Very many of the most-prised flowers of cultivation belong to this family, as the primrose, cowally, polyanthus, surfoutly, cyclamen, and soldanelle. For the best known genera, see Primula (the type), Lysianschia, Oyclamen, Trientalis, Claux, Corie, Samotus, Soldanella, Dedecatheon, and Hottonic. and the capsular ovary containing two or more

primum frigidum (pri'mum frij'i-dum). [L.: primum neut. of primus, first: frigidum, neut.

primum, neut. of primus, first; frigidum, neut. of frigidus, cold: see prime and frigid.] Pure cold: an elementary substance, according to the dectrine of Parmenides.

The first means of producing cold is that which nature presenteth us withal: namely, the expiring of cold out of the inward parts of the earth in winter, when the sun hath no power to overcome it, the earth being (as hath been noted by some) primum frigidum. Bacon, Nat. Hist., i. 69.

The dispute which is the prissum frigidum is very well known among naturalists; some contending for the earth, others for water, others for the sir, and some of the moderns for nitre, but all seeming to agree that there is some body or other that is of its own nature supremely cold, and by participation of which all other bodies obtain that quality. But, for my part, I think that before men had so holly disputed which is the prissum frigidum they would have done well to inquire whether there be any such thing or no. Boyle, Experimental History of Cold, title xvii.

primum mobile (pri'mum mob'i-lē). [L.: primum, neut. of primus, first; mobile, neut. of mobiles, movable: see prime and mobile.] In the Ptolemaic system of astronomy, the tenth or outermost of the revolving spheres of the universe, which was supposed to revolve from east to west in twenty-four hours, and to carry the others along with it in its motion; hence, any great or first source of motion.

The motions of the greatest persons in a government ought to be as the motions of the planets under primum mobile, ... carried swiftly by the highest motion, and softly in their own motion.

2. The title of the ruler of a principality: as, the Prince of Waldeck; the former Princes of the Prince of Waldeck; the former Princes of Orange. Few such principalities now exist in Europe; they are either small in extent (as Montenegro and Monaco), or in certain relations subordinate in name or reality to a suserain (as Bulgaria), or to a central government (as Lippe, Waldeck, and the other principalities of the German empire).

3. A title of nobility in certain countries on the countries of the coun

the continent, superior to duke: as, Prince Bismarck; Prince of Condé. There are, however, many exceptions in the relative standing of particular titles, owing to the fact that many princely designations are little more than courtesy titles, or to the circumstance that some princely titles are historically and intrinsically of comparatively small importance, while some ducal titles, on the contrary, are of the highest, sometimes even of soverign dignity. Prince is the translation of the chief Russian title of nobility (Ingus).

4. A courtesy title given to non-regnant members of royal families, and often confined to the younger sons of the soveroign: as, Prince Arthur (of Great Britain); Prince Henry (of Prussia); the eldest sons are usually called prince with a territorial title (as Prince of Walos, in Great Britain; Prince of Naples, in Italy), crown prince (Greece), prince imperial the continent, superior to duke: as, Prince

(Austria, Germany, etc.), prince imperial (Austria, Germany, etc.), prince royal (Denmark, Sweden, etc.), or duke with a territorial title (as Duke of Sparta, in Greece; Duke of Brabant, in Belgium).

Prince, King, Sovereign, Monarch, Emperor. Prince has a narrow and a broad meaning. It may indicate a son of the covereign, or it may be a general word for king, etc., as often in Shakspere. A country not large enough to be ruled by a king may be ruled by a prince, as some of the states of Germany, and Montenegro. Sovereign is an impressive but somewhat general term, being applicable to a king or an emperor, and expressing a high degree of power and dignity. Monarch expresses the fact of ruling alone, and therefore is generally, though not necessarily, applied to one ruling autocaratically and with splendid state, with similar figurative use. Emperor is cometimes affected, as a grander word than king, and seems to express more of absolutism and grandeur. Historically, emperor is especially associated with military command.

Without entering on the various meanings of the torm

Principle, which Aristotle defines, in general, that from
whence anything exists, is produced, or is known, it is sufficient to say black it is always used for that on which some
thing else depends; and thus both for an original law and
for an original element. In the former case it is a regulative, in the latter a constitutive, principle.

Sir W. Hamilton, Reid, Note A, § 5, Supplementary
[Dissertations.]

It is only by a very careful observation that we are able from the singular and concrete operations to enunctate precisely the general law which is the expression of the regulative principle. It is very difficult to distinguish it [the specification of the hot-blast furnace for throwing hot air into a furnace instead of coal, thereby increasing the intensity of the heat] from the specification of a patent for a principle, and this at first created in the minds of the court much difficulty; but, after full consideration, we think that the plaintiff hoes not merely claim a principle, but a machine embodying a principle, and a very valuable one. We think the case must be considered as if, the principle being well known, the plaintiff had first invented a mode of applying it by a mechanical apparatus to furnaces, and his invention then consists in this—by interposing a receptacle for heated air between the blowing apparatus and the furnace.

printing (prin'ting), n. [Verbal n. of print. r.]

1. In general, the art or process of making copies

or superficial transfers by impression; the reproduction of designs, characters, etc., on an impressible surface by means of an ink or a pig

ment (generally oily) applied to the solid suree on which they are engraved or otherwise amed. This sense is used specifically in typography the actual taking of impressions by the operation of pross; in other uses, it is generally accompanied by one descriptive term; and in typography itself different ethois are discriminated, as type, letterpress, or stereope printing, color-printing, etc. Type or stereotype inting is done from a surface in high relief; lithographic printing, from the surface of a flat stone; copperate printing, from the surface of a flat stone; copperate printing, from the surface of a flat part of printing in high printing from inked lines engraved in this according in the surface of a flat plate of copper or steel. The art of printing in high printing from the blocks of wood was practised in thins at early undetermined date. Silk and linen fabrics were controlled from engraved hand-stamps in Kurope in the welfth century; playing-cards and prints of images were impressed on paper in the beginning of the fourteenth century. Calloo-printing, olicioth-printing, and carpeting are also distinct arts, each requiring specially made inks and machinery. Printing for the blind, in letters embossed in relief, is the only form of printing done without tak. ce on which they are engraved or otherwise

century. Cauco-printing, olicoth-printing, and carpetprinting are also distinct arts, each requiring specially
made links and machinery. Printing for the blind, in letters embossed in relief, is the only form of printing done
without link.

2. The art or process of producing printed matfer for reading (including illustrations, etc.) by
composition and imposition of types, and their
subjection when inked to pressure upon paper in a printing-press; the typographic art;
typography in the fullest sense. Although doonments of a much earlier date exist, which show strong
evidence of having been printed in some manner analogous
to the modern practice, the history of printing properly
begins with the first use of movable moded types, and is
accredited to Gutenberg, with the aid of Schoeffer and
Fust, of Mains in Germany, in which city appeared the
first book with an authenticated (written) date, 1456.
Gutenberg's invention, however, is disputed in favor of
his contemporary Coster, of Haarlem in Holland, from
whom the former is said to have derived the process.
Improvements have since been made in the speed of
type-making and in the nothods of type-stiting, but
there has been no radical change in their theory or process. The simple screw hand-press first used for printling from types received no considerable improvement
before 1800. Since that date many inventions have been
made in printing-machinery, and the collateral arts of
stereotyping and electrotyping have been developed.

Many such machines have been invented. Platen-machines are provided with flat beds for the types, which are impressed by flat platens. Favorite styles of platen-machines for book-work are the Adams press of America and the Napier press of England; for job-work, the Gordon press of America and the Cropper press of England. Cylinder-machines are provided with flat sliding bed-plates for the type-forms, which at intervals are impressed by a rotating cylinder. (See spitiater press.) Rotary machines are provided with cylinders on the curved surface of which the types or plates are fixed, and which are impressed by another rotating cylinder on the surject is impressed by or or more impression-cylinders, which make a corresponding number of impressions at every rotation. All forms of platen- and cylinder-machines receive, by hand-feeding, cut sheets of paper which are delivered printed usually on one side only, and not folded. Some forms of cylinder-machines are provided with two cylinders for printing a sheet on both sides or in two colors. Web-machines (so called because they use paper in a web-roll, which may be two or more miles long are provided with cylinders on the curved surface of which the plates are fastened, and which are impressed by other cylinders on both sides. Nicholson of England received a patent for a cylinder printing-machine in 1790, but his invention was never perfected. Keenig and Bauer in 1811 did the first practical work on their machine, which in 1814 was used to print the London "Times. Early forms of cylinder-machines have been largely improved by Napler of London and Hoe of New York. The web-machine was introduced in 1863, and has received many improvements from Applegrath of London and Dolegrath of London and London a ceived many improvements from Applegath of London, Marinoni of Paris, Roe of New York, and others.

for taking impressions from an inked surface upon paper. A press that prints from stone is always specified as a lithographic press; a press that prints from stone or engraved copperplates, as a copporplate-press. Presses for typographic printing are broadly divided into three classes—hand-presses, job-presses, and power-presses. Those of the last class are treated under printing-machine. The early hand-press was largely of wood. A stone was provided as a bed for the form of types, and iron for minor pieces only. Impression was made by the direct action of a screw on the platen or pressing surface, which covered only one half of the bed-plate of stone. The first notable improvement was that of Stanhope of England, who in 1786 made a hand-press entirely of iron, with a platen that fully covered the bed-plate. Many improvements have followed. The hand-presses now preferred

prior (pri'or), n. [< ME. priour, preyour = D. prioor = MLG. prior, prier = MHG. prior, G. prior = Sw. Dan. prior, < OF. priour, prieur, F. prieur = Sp. Pg. prior = It. priore, < ML. prior, a prior, its superior, < L. prior, former, superior. Specifically and rank to an about. Before the thirteenth century he seems to have been called priors (prepositus) or prelate (prelatus), and prior seems to have meant any superior or semior. If in an about, and an assistant of the abbot, he is called a claustral prior; if the superior of a priory — that is, of a monastery of lower than abbatial rank — he is called a comenitical or comentual prior. The superiors of the houses of regular canons, were always called priore, and the commandants of the priories of the military orders of St. John of Jerusalem, of Malta, and of the Templars were called grand priors. See kegumen.

3. In law, a precedence or preference, as when one debt is paid in priority to others, or when an execution is said to lose its priority by the neglect of the party to enforce it.—4. Apriority.—8yn. Priority Antecedence, Precedence. Pretindence, Precodence of the party to enforce it.—4. Apriority.—8yn. Priority Antecedence is strictly priority is the state or fact of coming first in order of time; what little use it has beyond this meaning is only a figurative extension. Antecedence is strictly priority, without any proper figurative use. Precedence may mean priority, but generally means the right to go or come inst, the privilege of going before another: as, the question of precedence among severeigns or ambassadors makes great trouble, because the dignity of the nations represented is supposed to be at stake. Preintennes is, figuratively, height by nature above all others, generally in some one respect: as, the preeminence of Shakspere as a dramatist. Predominance is superior and dominating power or influence: as, the predominance of light or shade or a particular color in a certain ploture. Preference is the putting forward of a person or thing by choice, on the ground of worthiness, or on account of the taste, fancy, or arbitrary will of the one preferring: as, to give the preference to Milton over Dante. Superiority may refer to nature or to given or schieved position over others; it differs from the superiority of the dairy-products of a certain troops; the superiority of the dairy-products of a certain region; superiority one's circumstances; supremacy on the land and supremacy on the sea do not always go together. Specifically—2. An optical instrument consisting of a transparent medium so arranged

that the surfaces which receive and transmit light form an angle with each other; usually of a triangular form with well-polished sides, which meet in three parallel lines, and made of glass, rock-salt, or quartz, or a liquid, as carbon disulphid, contained in a prismatic receptacle formed of plates of glass. A ray of light falling upon one of the sides of a prism is refracted (see refraction) or bent from its original direction at an angle depending upon its own wave-length, the angle of incidence, the angle of the prism, and the material of which the prism is made. This angle of deviation, as it is called, has definite minimum (minimum deviation) value when the angle of incidence is equal to the angle of emergence.

The angle of deviation increases as the wave-length of the light-ray diminishes; consequently, if a pencil of white light falls upon the prism, the different rays are separated or dispersed, and a spectrum is the result. (See spec-trum.) Prisms are hence used in spectrum analysis to decompose light, so that the rays of which it is made up may be examined.

8. In crystal., a form consisting of planes, usu-3. In crystal., a form consisting of planes, usually four, six, eight, or twelve, which are parallel to the vertical axis. If the planes intersect the lateral axes at the assumed unit distances for the given species, it is called a unit prime; otherwise it may be described, according to the pusition of the planes, as a suscropriem, brackspriem, orthogram, or disapriem. In the triclinic system the form includes two planes only, and it is hence called a hemiprism. In the tetragonal system the unit priam is sometimes called a protogram, or prism of the first order, and the dismortal priam, whose planes are parallel to a lateral axis, a deuteroprism, or prism of the second order; these names are also used in an analogous manner in the hexagonal system.
